Labour Market Monitor 2019

An EU-wide Labour Market Monitoring System Updated Annually

Executive Summary: EU in a Nutshell

Ulrike Huemer, Helmut Mahringer

March 2020

Austrian Institute of Economic Research

Commissioned by the Chamber of Labour: Vienna

Internal review: Julia Bock-Schappelwein • Research assistance: Anna Brunner

Abstract

The report is an update of a set of labour market indices first developed and tested in 2010 in collaboration with experts of the Vienna Chamber of Labour (AK). The Austrian labour market is examined relative to the other 27 EU countries (including UK) according to the following key dimensions: overall labour market performance, participation of different groups of people, exclusion risks on the labour market, distribution of earnings and redistribution by the welfare state

1. Introduction

The assessment of the labour market situation in the member countries of the European Union is often carried out by Eurostat based on a few regularly updated key indicators. In particular, much emphasis is placed on the unemployment rate in public and political debate. However, focusing on a single indicator captures only a certain aspect of the labour market. Against this background, the Vienna Chamber of Labour (AK) aims to more closely examine a broader spectrum of labour market issues within a European context. In 2010, in collaboration with WIFO, a team of AK (Austrian Federal Chamber of Labour) and ETUI (European Trade Union Institute) experts identified five key labour market dimensions:

1. Overall labour market performance
2. Participation
3. Exclusion risks on the labour market
4. Distribution of earnings
5. Redistribution by the Welfare State

Based on a series of indicators, an index was created for each of these five dimensions and applied to all EU member countries. The labour market monitor, therefore, consists of five separate indices (dimensions). Each index can have a value between 1 and 10 for the countries considered, with 1 representing the worst and 10 the best possible outcome.

Indicators that are comparable and regularly available throughout Europe are used. This facilitates regular updates of these five indices and allows for monitoring over time. The present edition represents the ninth update of the labour market monitor.

The advantage of this set of instruments lies in the

- bundling of complex economic, political and social contexts into a few index values,
- comparison of national conditions, which can also be used for benchmarking,
- regular and fast updates,
- creation of a descriptive overview that can serve as a starting point for more in-depth analysis.

The labour market monitor should represent a monitoring system that condenses significant aspects of labour market development from a multitude of indicators. However, the generation of indices also represents a tightrope walk. On the one hand, indices reduce the complexity of the information processed; on the other hand, it is precisely this reduction that bears the risk of misinterpretations – we aim to counteract by a transparent methodology and documentation of data and methods as well as by the separate presentation of five aspects of the labour market.

The present report summarises the current results¹ of the five dimensions of the labour market monitor: It provides a (carto-)graphic overview and presents the main characteristics of the top countries in the five key labour market dimensions defined. In addition, this year's edition of the Executive Summary outlines the long-term development of labour market performance (dimension 1 "overall labour market performance").

2. Labour market monitoring with the labour market monitor

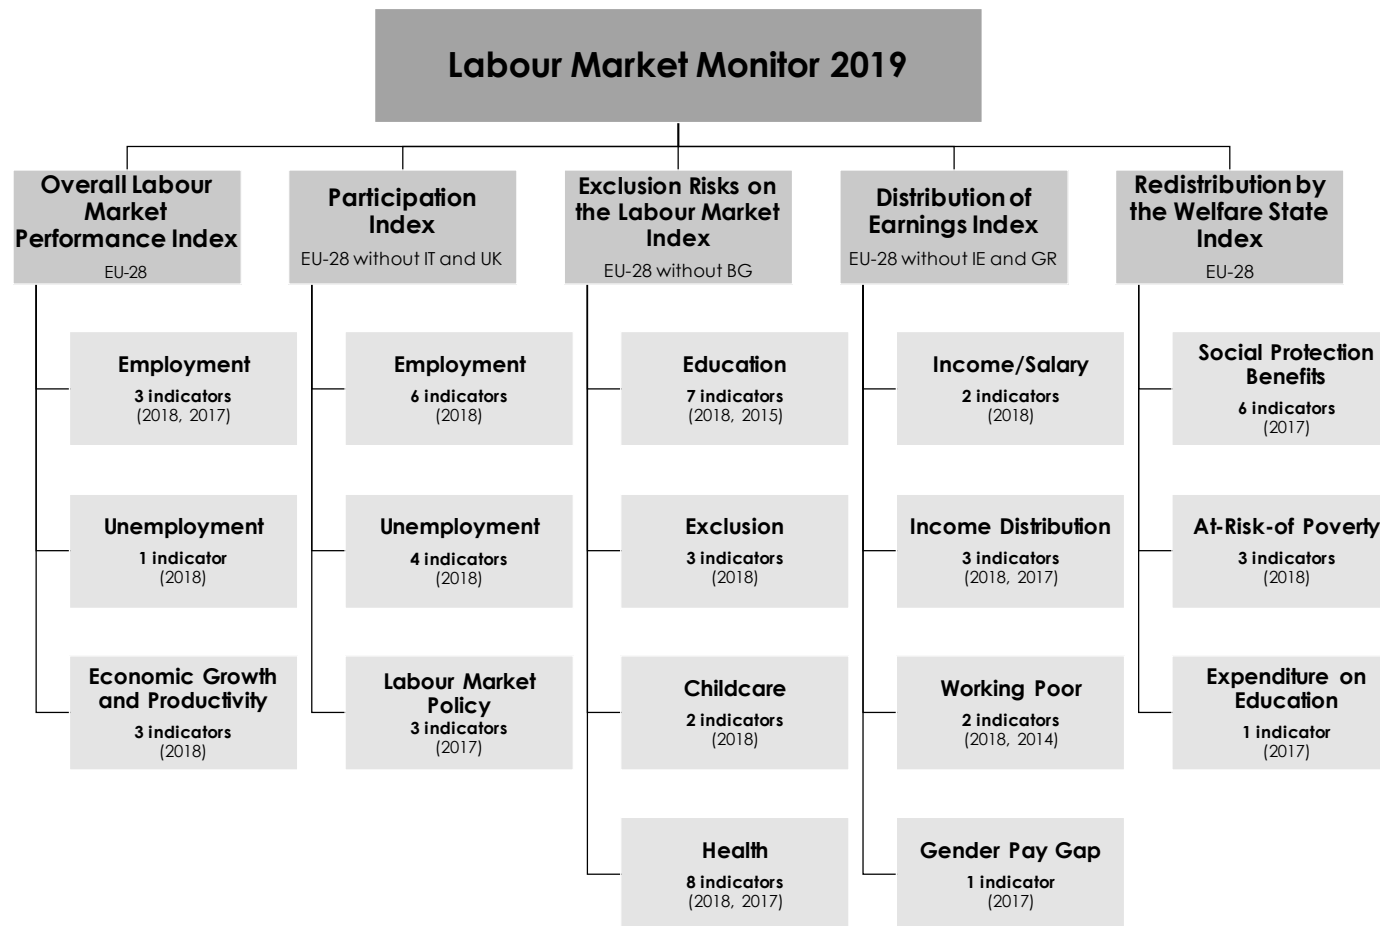

A total of 58 indicators are represented in the labour market monitor and its five dimensions. Content related considerations, as well as the aspects of regular availability and comparability of data determined the selection of indicators. The labour market monitor is mainly based on data from Eurostat (EU-LFS and EU-SILC) and always uses the most recent data – in the 2019 labour market monitor these were primarily data from the years 2017 and 2018. However, not all indicators are as quickly and completely available as others. Where the most recent data for individual countries are missing, data from the previous year are used. If this information is also missing, the country in question is left out of the calculation.

2.1 The five dimensions

- Dimension (1), "overall performance", refers to the labour market in the context of the overall economic situation of a country based on the interplay of employment, unemployment, economic growth and productivity (seven indicators). Dimension 1 reflects, like dimension 2, general aspects of the labour market.
- Dimension (2), "participation", captures the extent to which different groups of people (e. g. young and old, women and men) are integrated into the labour market and is measured based on 13 indicators.
- Dimension (3), "exclusion risks on the labour market", should capture the capacity of a country to enable fair access to the labour market and the chances of remaining employed; here, an important role is undoubtedly played by the level of education and the availability of childcare infrastructure, and 20 indicators are used in this dimension.
- Dimension (4) shows the "distribution of earnings" based on eight indicators.
- Dimension (5) "redistribution by the Welfare State" uses ten indicators to measure the effectiveness of state interventions and public expenditures for social protection and education.

Structure of the Labour Market Monitor 2019: dimensions and sub-dimensions

S: WIFO.

2.2 Index methodology

The calculation of the five dimensions is based on standard methods of index construction (see Haas *et al.* 2010, p. 15ff). This involves a multi-step process. In a first step, the indicators, which are in part measured in different units (e. g. Euros, percentage shares) are normalized by using the min-max method. In a second step, the standardized indicators are transformed on a scale of 1 (worst value) to 10 (best value). In a third step, the indicators are weighted (based on their standard deviation), thus making sure that indicators with a higher variation are not represented disproportionately higher or exert a higher influence on the overall index. In a fourth step, the values gained for each index in steps 1 to 3 are added together and once again normalized and transformed. This way, the different country and dimension indicators of the Labour Market Monitor are condensed into one index figure.

Multi-step calculation process for the five indices including sensitivity analysis

S: WIFO.

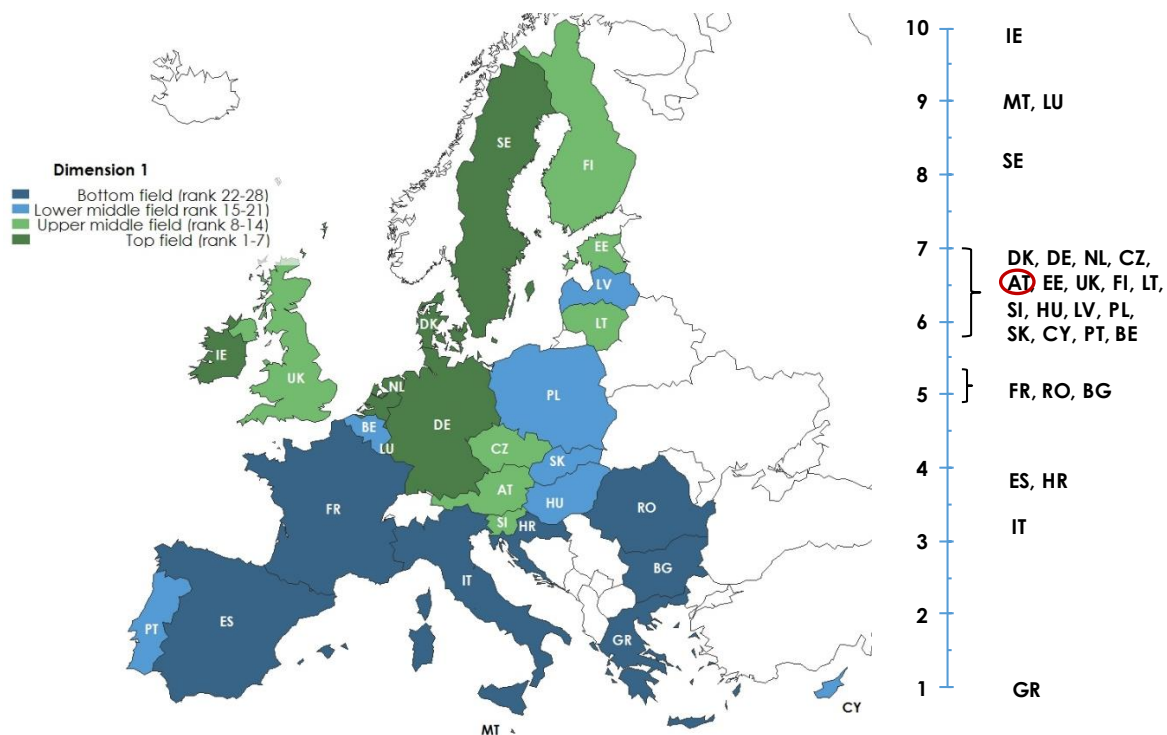

Finally, a sensitivity analysis is applied to test the robustness of our results and compare the performance of the index to alternative configurations (change of weighting of indicators or the composition of indicators per index). This model proves highly robust with respect to the different weighting variations and selection of indicators.

2.3 Presentation of results

Based on the calculated point values four country groups are formed along the quartile limits ("top field", "upper middle field", "lower middle field", and "bottom field"). These country groups are used to carry out a comparison to the previous year: not the changes in rankings but rather the categorization of the Member States in terms of the four groups of the distribution are evaluated. In forming four equally occupied country groups, however, the distance in point values between neighbouring groups can be quite small. For this reason, an additional alternative group categorisation is carried out: countries are clustered in such a way as to minimize the distance between the countries' point values within each group, while at the same time maximize the distance to the neighbouring groups (point difference of at least 0.5 on the ten-part point value scale). No prior-year comparison is made for this alternative group categorisation. The following points must be taken into consideration when interpreting the indices: despite a comprehensive selection process of figures, an index can never completely capture all national differences and country-specific institutional contexts.

Dimension 1 "Overall Labour Market Performance"

The first dimension "Overall labour market performance " contains 7 indicators that represent the labour market performance of a country in an overall economic context: the extent of employment of the working-age population (employment rate, employment rate in full-time equivalents) and employment growth compared to the previous year, the current level of unemployment (unemployment rate) and the economic performance of a country (economic growth and productivity: real GDP per capita – absolute value in Euros and development over time, as well as labour productivity per person employed).

S: Labour Market Monitor 2019.

What characterizes the countries of the top field?

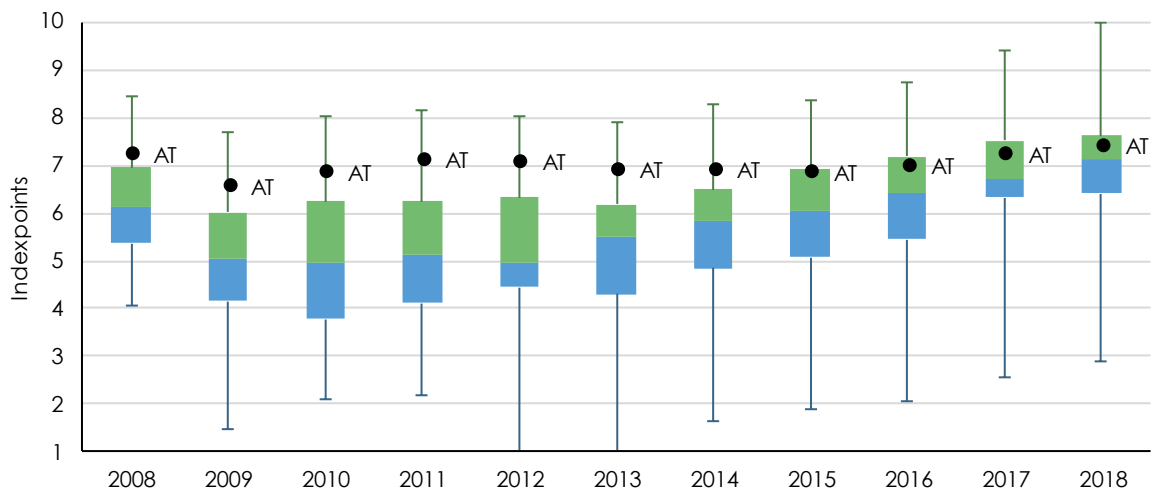

- **High economic performance:** Most of the top countries have a **very high** (LU 83,470€, IE 57,960€, DK 48,260€, SE 43,810€, NL 41,540€) **or high** (DE 35,860€) **real GDP per capita, with above-average labour productivity per employee.** The last country in the top field, Malta, shows an above-average economic growth rate instead (10-year perspective: +35,2% since 2008).
- The top countries are characterised by **either a very high employment rate** (SE 77.4%, DE 75.9%, DK 74.1% and NL 77.2%) **or very high employment growth** (MT 5.7%, LU 3.7%, IE 3.2%).
- **Unemployment** in the countries of the top field is **very low** (DE 3.5%, MT 3.7%, NL 3.8%) **or at least below average** (DK 5.3%, LU 5.6%).

10-year-trend in the Overall Labour Market Performance Index of the EU-28

- Marked **increase in divergence** between EU member states **in the wake of the financial and economic crisis**.
- **Since 2014** there has again been a **tendency towards convergence** of the labour market performance of the EU member states.
- At present (data for 2017/2018) there is still a **massive discrepancy in the labour market performance** of the EU member states; it is **considerably stronger than it has been before 2009**.

Development of the index point values of the countries in the area index

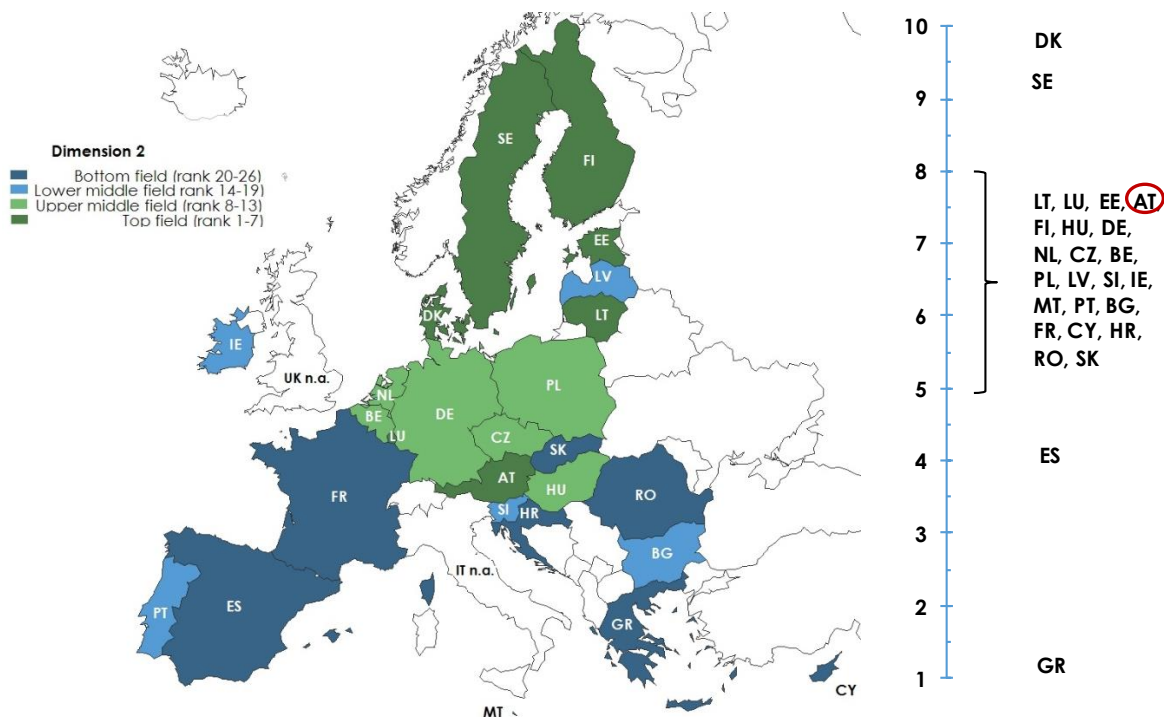

Reference year 2018, all EU member states

S: Labour Market Monitor 2019. – Range of index points. Legend: The box plot diagram visualizes the scatter and location of the countries' scores per year. In the box (green plus blue area) are the middle 50% of the countries, i. e. the upper and lower middle field. They are limited by the upper and lower quartile; the transition from the green to the blue area represents the median: 50% of the countries are smaller or equal to this value. The edges of the box plot mark the country with the lowest and highest score in the year or the country with the worst rank and the best rank per year. – To compare the point values over time, the index point values were normalized on the basis of a global minimum and maximum, i. e. for each indicator the smallest and the largest value in the period 2008 to 2018 was searched for and used for normalization (min-max method).

Dimension 2 "Participation"

Area index 2 "Participation" captures the extent to which the labour market and employment system is able to integrate different groups of people. It comprises 13 indicators: Indicators on the employment (employment rates of different age groups, employment gender gap, involuntary part-time employment, involuntary temporary employment), indicators on the unemployment structure (unemployment rate of young and older people, long-term unemployment rate and long-term unemployment rate of older people) as well as indicators from the field of active labour market policy (expenditure as a percentage of GDP and as a percentage of GDP per percent unemployed, participation in labour market measures).

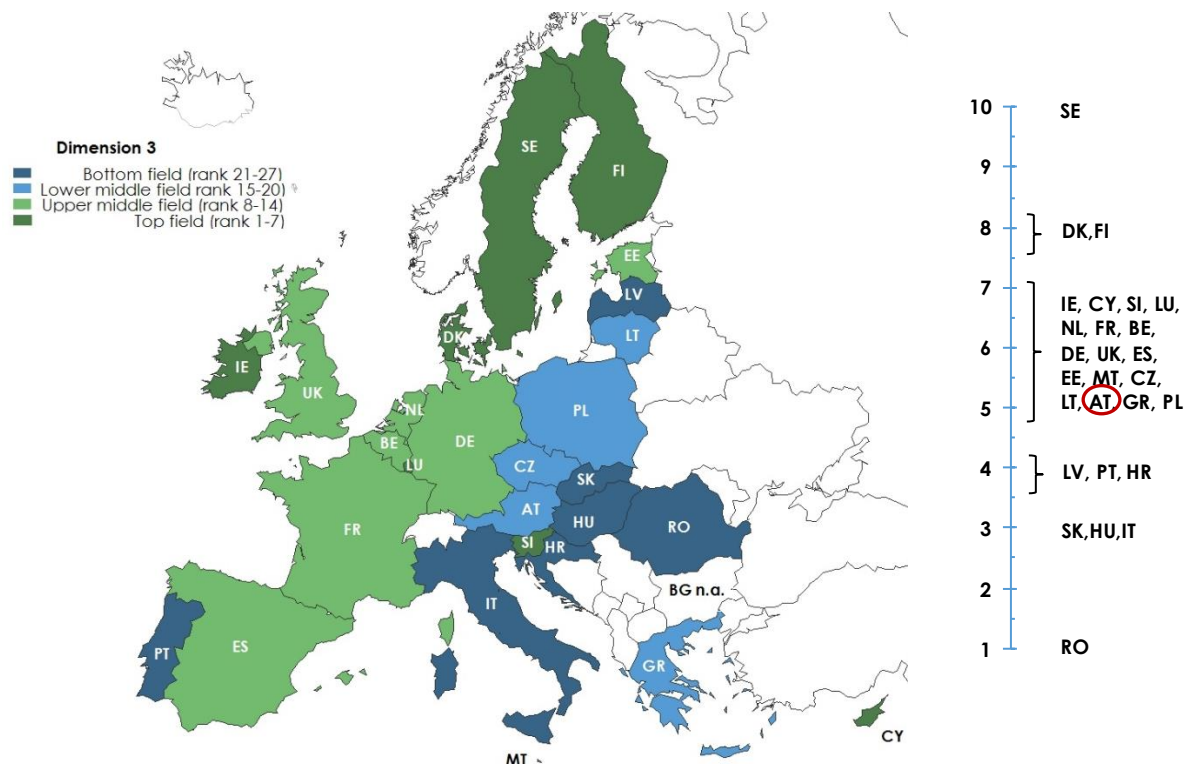

S: Labour Market Monitor 2019. – Index calculation without UK and IT.

What characterizes the countries of the top field?

- The countries of the top field have **different strengths and weaknesses**.
- All top countries have in common a **below-average long-term unemployment rate** (EU-28 43.4%).
- In most countries of the top field, **investment in active labour market policy is high** (expenditure on active labour market policies as a percentage of GDP).
- In most countries of the top field **employment rate for people of prime working age** (25- to 44-year-olds) is **relatively high** and the **employment gender gap is relatively low**.

Dimension 3 "Exclusion Risks on the Labour Market"

Area Index 3 "Exclusion risks on the labour market" deals with the main determinants of labour market opportunities; it comprises 20 indicators on aspects of education, exclusion, health and childcare: The education dimension comprises seven indicators reflecting the level of education and participation of the population in further education; the exclusion dimension comprises two indicators reflecting individual care obligations and an indicator of the level of inactivity at working age. The childcare dimension shows the extent to which a country offers childcare infrastructure. The health dimension contains eight indicators that show the general health status of the (working age) population.

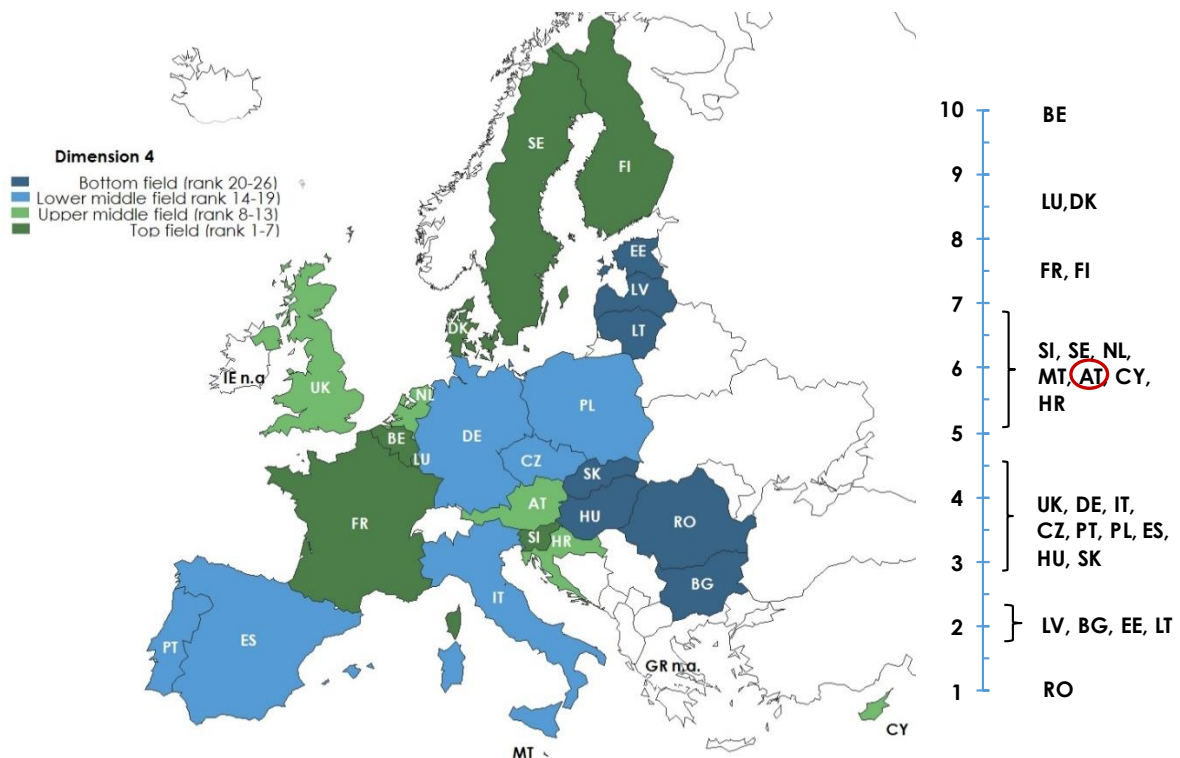

S: Labour Market Monitor 2019. – Index calculation without BG.

What characterizes the countries of the top field?

- Countries which are best at minimising the risks of exclusion from the labour market **tend to perform well in education**: the **NEETS rate** (EU-28 10.6%) and the **proportion of 25- to 64-year-olds with no more than compulsory education** (EU-28 21.9%) are **below average**, the **proportion with tertiary education** (EU-28 32.3%) is **above average**.
- In most of the top field countries, the **inactivity rate** (EU-28 26.3%) and the **part-time rate due to care responsibilities** (EU-28 4.3%) are **below average**.
- However, the **results** of the top field countries in the other two areas – **health and formal childcare** – are **heterogeneous**.

Dimension 4 "Distribution of Earnings"

The area index 4 "Distribution of Earnings" deals with the level and distribution of income. Eight indicators are included in the assessment: The average level of earnings, the functional and personal distribution of primary incomes (compensation of employees in percentage of GDP and income distribution quintiles as a measure of inequality in income distribution), taxes on labour as a percentage of total taxation, the gender pay gap and the proportion of the low-wage earners (basis: gross hourly earnings) as well as the extent of "working poor".

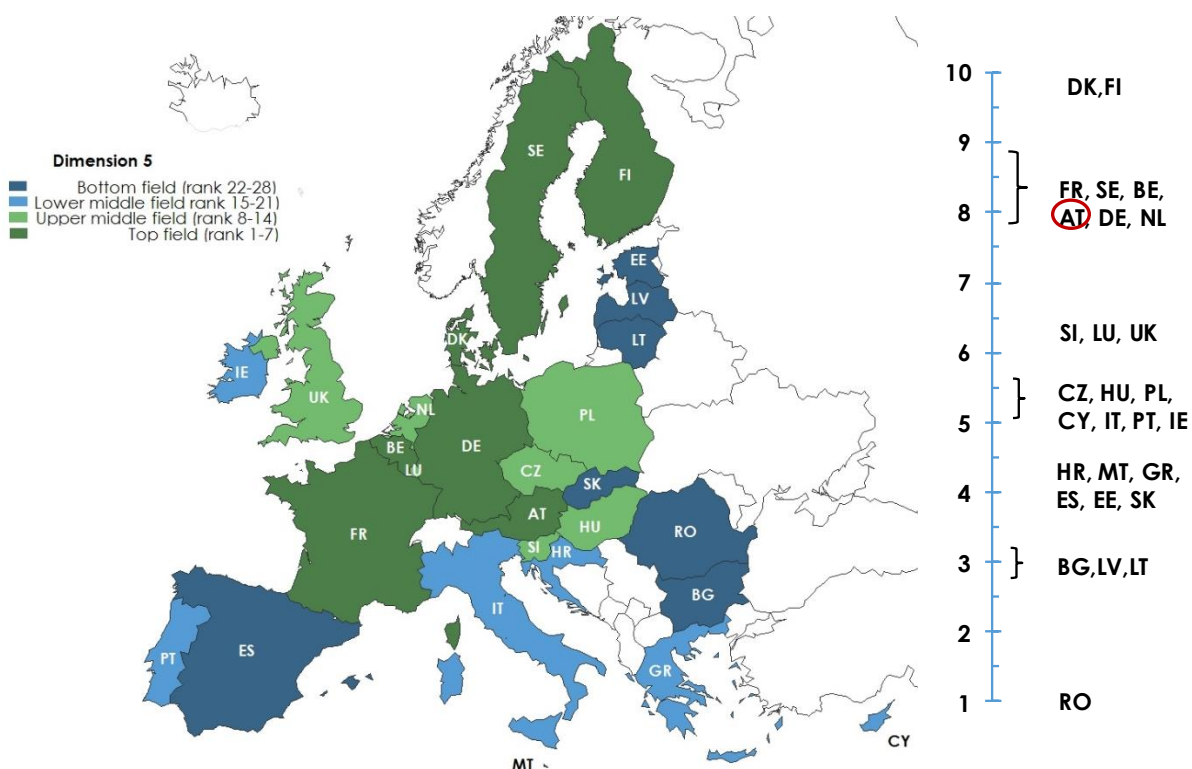

S: Labour Market Monitor 2019. – Index calculation without GR, IE.

What characterizes the countries of the top field?

- **Income inequality** and the proportion of working poor in the top countries (except for LU) is **below average**.
- Most of the countries in the top group has above-average incomes and the **share of low-wage workers** (EU-28 17.2%) are **below average**.
- Most of the top field countries have **an above-average share of tax revenue on labour** (EU-28 49.7%). The relative importance of the factor labour in the tax system is thus high; however, this ratio does not allow any conclusions to be drawn regarding the absolute burden on the factor labour and the tax ratio.

Dimension 5 "Redistribution by the Welfare State"

The area index 5 "Redistribution by the Welfare State" focuses on social welfare and levels of transfer in the EU countries. The index encompasses a total of ten indicators: Six indicators on the extent and structure of social protection benefits by various functions (sickness/health care, old age, family/children, unemployment, disability, survivors/social exclusion/housing) and one on educational expenditure as a percentage of GDP as well as three indicators on the risk of poverty.

S: Labour Market Monitor 2019.

What characterizes the countries of the top field?

- According to the conception of this index, the top countries spend a **relatively high share of GDP on social benefits** (27.2% to 31.7%).
- They all have an **at-risk-of-poverty rate** (after social transfers) **below EU average** (EU-28 17.1%). In most of these countries social transfers tend to make an above average contribution to reducing the at-risk-of-poverty rate (EU-28 8.5 percentage points).
- Countries with a **low at-risk-of-poverty rate** also tend to have a **low at-risk-of-poverty gap** (gap between the average income of people at risk of poverty and the at-risk-of-poverty threshold).
- The majority of the countries at the top of the league have **above-average educational expenditure** as a percentage of GDP (EU-28 4.6%).

Table appendix

In the following, both the raw data and the results of the Labour Market Monitor 2019 are presented in tabular form of the rankings. At the request of experts from the Vienna Chamber of Labour, some indicators were included in the raw data on a gender-specific basis, so separately for men and women. However, indicators which are presented by gender are only included in the calculation of the respective dimension indices as "total".

The calculation of the sector indices is based, with a few exceptions, predominantly on the years 2018 and 2017; exemptions are indicated. Some countries have the same ranking because they have the same scores. Equal rankings are also indicated.

The raw data are presented for all EU-28 member states, if available. However, due to missing data, not all EU-28 member states could be included in the calculation for three out of five dimension indices.
