Labour Market Monitor 2020

An EU-wide Labour Market Monitoring System Updated
Annually

Executive Summary: EU in a Nutshell

Ulrike Huemer, Helmut Mahringer

April 2021

Austrian Institute of Economic Research
Commissioned by Chamber of Labour: Vienna

Internal review: Julia Bock-Schappelwein
Research assistants: Anna Albert, Marion Kogler

The report is an update of a set of labour market indices first developed and tested in 2010 in collaboration with experts of the Vienna Chamber of Labour (AK). The Austrian labour market is examined relative to the other 27 EU countries (including UK; reference year 2019) according to the following key dimensions: overall labour market performance, participation of different groups of people, exclusion risks on the labour market, distribution of earnings and redistribution by the welfare state.

1. Introduction

The assessment of the labour market situation in the member countries of the European Union is often carried out by Eurostat based on a few regularly updated key indicators. In particular, much emphasis is placed on the unemployment rate in public and political debate. However, focusing on a single indicator captures only a certain aspect of the labour market. Against this background, the Vienna Chamber of Labour (AK) aims to more closely examine a broader spectrum of labour market issues within a European context. In 2010, in collaboration with WIFO, a team of AK (Austrian Federal Chamber of Labour) and ETUI (European Trade Union Institute) experts identified five key labour market dimensions:

1. Overall labour market performance
2. Participation
3. Exclusion risks on the labour market
4. Distribution of earnings
5. Redistribution by the Welfare State

Based on a series of indicators, an area index was created for each of these five dimensions and applied to the EU 28 countries¹⁾. The Labour Market Monitor, therefore, consists of five separate area indices (dimensions). Each index can have a value between 1 and 10 for the countries considered, with 1 representing the worst and 10 the best possible outcome.

Indicators that are comparable and regularly available throughout Europe are used. This facilitates regular updates of these five indices and allows for monitoring over time. The present edition represents the ninth update of the Labour Market Monitor.

The advantage of this set of instruments lies in the

- bundling of complex economic, political and social contexts into a few index values,
- comparison of national conditions, which can also be used for benchmarking,
- regular and fast updates,
- creation of a descriptive overview that can serve as a starting point for more in-depth analysis.

The Labour Market Monitor should represent a monitoring system that condenses significant aspects of labour market development from a multitude of indicators. However, the generation of indices also represents a tightrope walk. On the one hand, indices reduce the complexity of the information processed; on the other hand, it is precisely this reduction that bears the risk of misinterpretations – we aim to counteract by a transparent methodology and documentation of data and methods as well as by the separate presentation of five dimensions of the labour market.

¹⁾ All countries for which data is available for all indicators are included in the respective index. The UK is still treated as an EU 28 member as its withdrawal from the EU was completed in February 2020 and the current version of the LMM mainly includes indicators for 2018 and 2019.

At the time of writing, the most recent data for the Labour Market Monitor was from 2019, so the economic crisis that began with the fight against or containment of the COVID-19 pandemic in 2020 is not yet reflected in the data. Against this backdrop, this edition outlines the situation prior to the current economic crisis and provides an important description of the initial situation. The look at the development of country performance over time in two dimensions of the Labour Market Monitor sheds light on the labour market's ability to recover after the financial and economic crisis in 2009 and describes what results were achieved at the peak of the economic cycle.

The present report summarises the current results²⁾ of the five dimensions of the Labour Market Monitor: It provides a (carto-)graphic overview and presents the main characteristics of the top countries in the five key labour market dimensions defined. In addition, this year's edition of the Executive Summary outlines the long-term development of labour market performance in area index 1 "Overall Labour Market Performance" and area index 2 "Participation".

2. Labour market monitoring with the Labour Market Monitor

A total of 58 indicators are represented in the Labour Market Monitor and its five dimensions. Content-related considerations as well as the aspects of regular availability and comparability of data determined the selection of indicators. The Labour Market Monitor is mainly based on data from Eurostat (EU-LFS and EU-SILC) and always uses the most recent data – in the 2020 Labour Market Monitor these were primarily data from the years 2019 and 2018. However, not all indicators are as quickly and completely available as others. Where the most recent data for individual countries are missing, data from the previous year are used. If this information is also missing, the country in question is left out of the calculation.

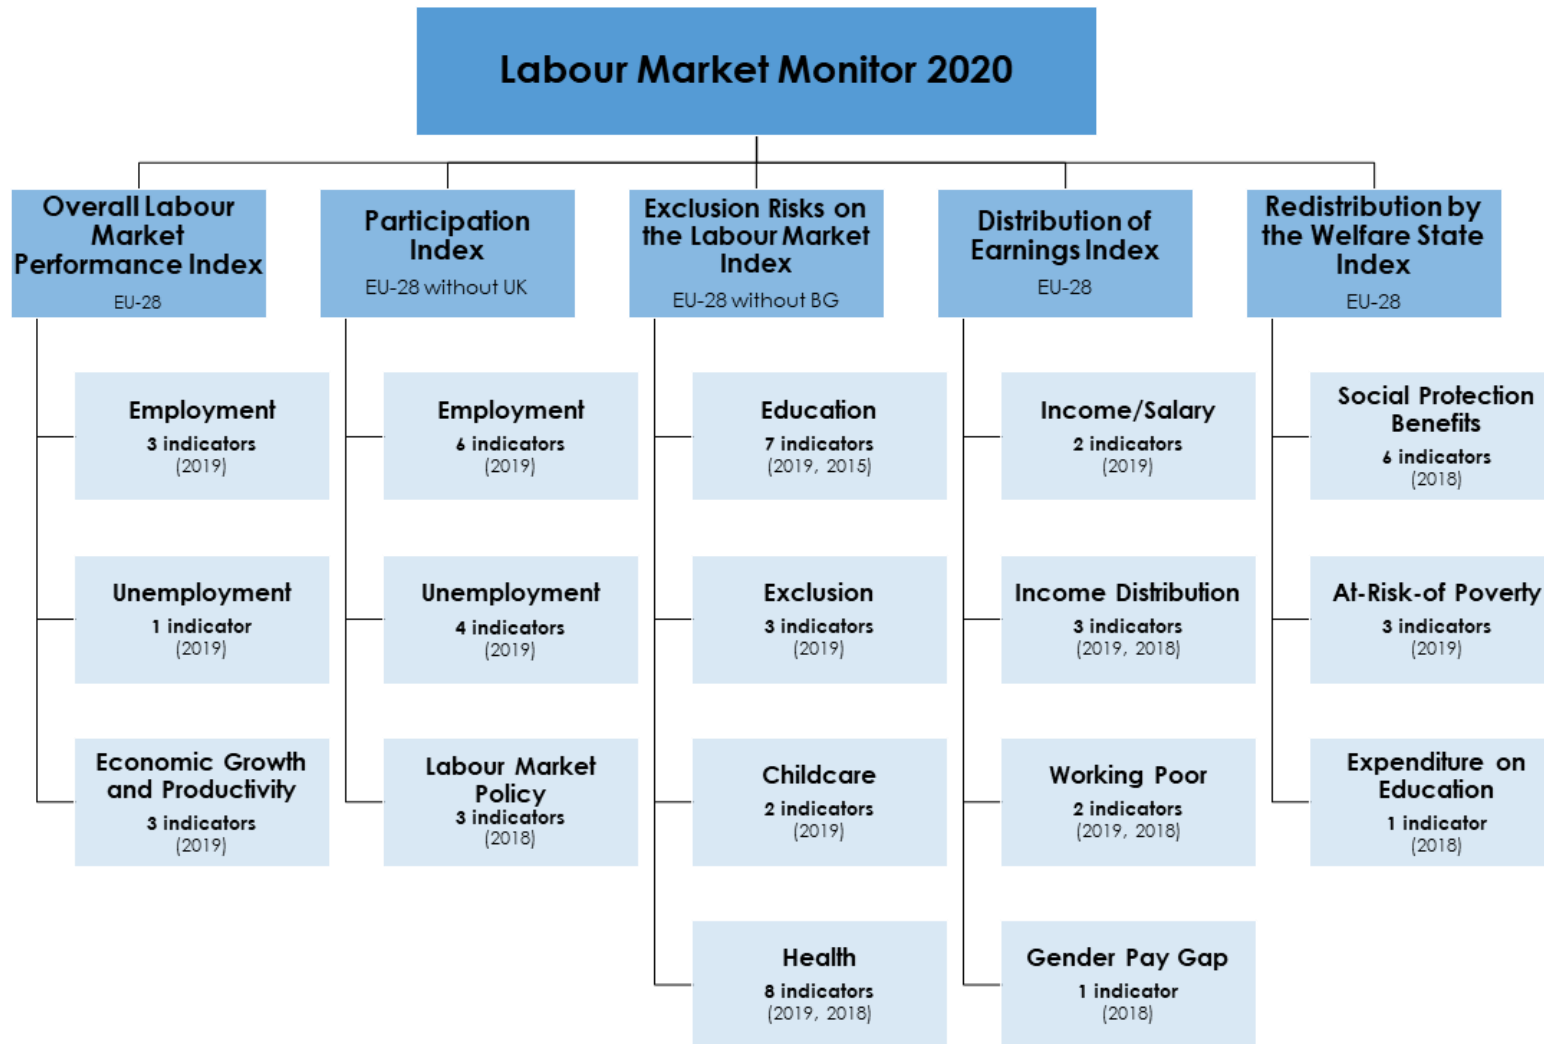

2.1 The five dimensions

- Dimension (1), "Overall Performance", refers to the labour market in the context of the overall economic situation of a country based on the interplay of employment, unemployment, economic growth and productivity (seven indicators). Like dimension 2, dimension 1 reflects general aspects of the labour market.
- Dimension (2), "Participation", captures the extent to which different groups of people (e. g. young and old, women and men) are integrated into the labour market and is measured based on 13 indicators.
- Dimension (3), "Exclusion Risks on the Labour Market", is intended to capture the capacity of a country to enable fair access to the labour market and the chances of remaining employed. The level of education and the availability of childcare infrastructure undoubtedly play an important role here, with 20 indicators being used in this area.
- Dimension (4) shows the "Distribution of Earnings" based on eight indicators.

²⁾ Huemer, U., Mahringer, H., Arbeitsmarktmonitor 2020 – Update des jährlichen, EU-weiten Arbeitsmarktbeobachtungssystems, WIFO, Vienna, forthcoming.

- Dimension (5), "Redistribution by the Welfare State", uses ten indicators to measure the effectiveness of state interventions and public expenditures on social protection and education.

Structure of the Labour Market Monitor 2020: dimensions and subdimensions

S: WIFO.

2.2 Index methodology

The calculation of the five dimensions is based on standard methods of index construction (see Haas *et al.* 2010, p. 15ff)³⁾. This involves a multi-step process. In a first step, the indicators, which are in part measured in different units (e. g. Euros, percentage shares) are normalized by using the min-max method. In a second step, the standardized indicators are transformed to a scale from 1 (worst value) to 10 (best value). In a third step, the indicators are weighted based on their standard deviation, thus making sure that indicators with a higher variation are not represented disproportionately higher or exert a higher influence on the overall index. In a fourth step, the values gained for each index in steps 1 to 3 are added together and once again normalized and transformed. This way, the different indicators per country and dimension of the Labour Market Monitor are aggregated to an area index figure (index point value).

Multi-step calculation process of the five indices including sensitivity analysis

S: WIFO.

Finally, a sensitivity analysis is applied to test the robustness of our results and compare the performance of the index to alternative configurations (change of weighting of indicators or the composition of indicators per index). This model proves highly robust with respect to the different weighting variations and selection of indicators.

2.3 Presentation of results

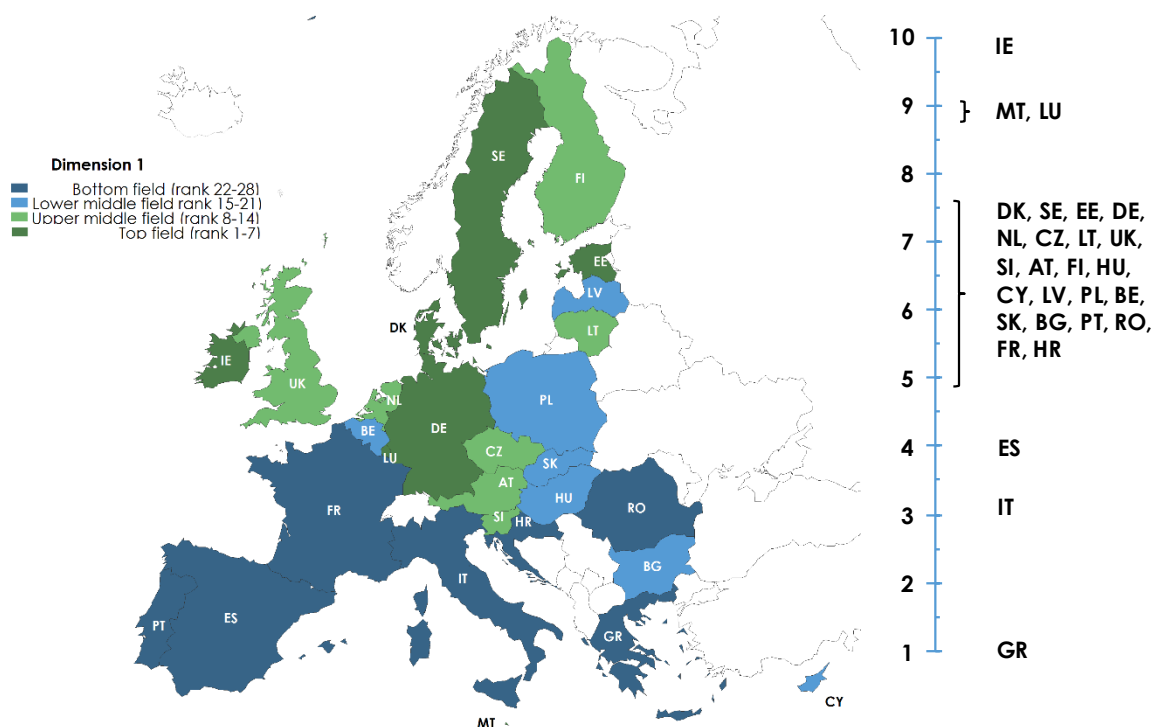

Based on the calculated index point values, four country groups are formed along the quartile limits ("top field", "upper middle field", "lower middle field", and "bottom field"). These country groups are used to carry out a comparison to the previous year: not the changes in rankings but rather the categorization of the countries in terms of the four groups of the distribution are evaluated. In forming four equally occupied country groups, however, the distance in index point values between neighbouring groups can be quite small. For this reason, an additional alternative group categorisation is carried out: countries are clustered in such a way that the distance between the countries' index point values within each group is minimised, while at the same time the distance to the neighbouring groups is maximised (index point value distance at least 0.5 on the ten-part scale). No prior-year comparison is made for this alternative group categorisation.

³⁾ Haas, S., Lutz, H., Mahringer, H., Rückert, E., Implementierung und Testung des „Arbeitsmarktmonitors der Arbeiterkammer Wien“, WIFO, Wien, Dezember 2010.

When interpreting the indices, it should be noted that despite a comprehensive selection of figures, an index can never fully capture all national differences and country-specific institutional contexts.

Dimension 1 "Overall Labour Market Performance"

Dimension 1 contains seven indicators that represent the labour market performance of a country in an overall economic context: the extent of employment of the working-age population (employment rate, employment rate in full-time equivalents) and employment growth compared to the previous year, the current level of unemployment (unemployment rate) and the economic performance of a country (economic growth and productivity: real GDP per capita – absolute value in Euros and development over time, as well as labour productivity per person employed).

S: Labour Market Monitor 2020.

What characterizes the countries of the top field?

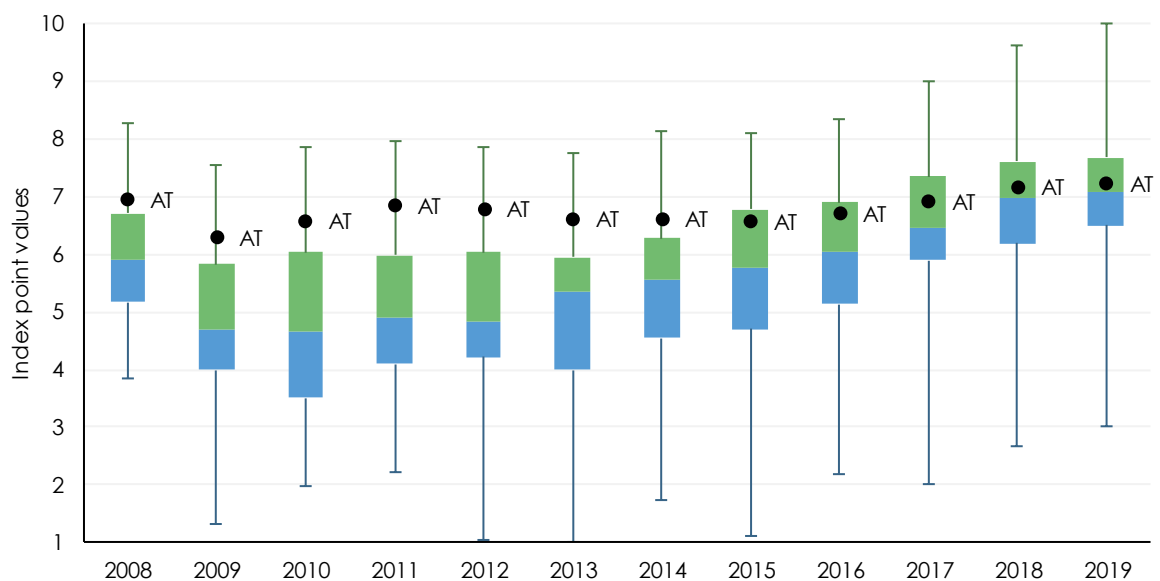

- **High economic performance:** Most of the top countries have a **(very) high real GDP per capita** (EU 28 28,610 €) with **above-average labour productivity per employee**. Malta and Estonia have below-average real GDP per capita, but above-average GDP per capita dynamics.
- The top countries are characterised by **either a very high employment rate** (EU 28 69.2%) **or very high employment growth** (EU 28 +1.0%).
- **Unemployment is below the EU 28 average** in most of the top countries (EU 28 6.4%).

Development of the EU 28 countries in dimension 1 "Overall Performance of the Labour Market" since 2008

- The **financial and economic crisis** at the beginning of the decade has left clear traces: The **labour market performance of the EU 28 countries** has **markedly diverged** in recent years based on the seven indicators of dimension 1 (**economic divergence within the EU 28 countries**).
- In 2019, the year before the COVID-19 pandemic, the differences between the EU 28 countries are greater than before 2008. However, **most of the EU 28 countries** were able to **recover** from the financial and economic crisis **by 2019**.
- The **speed of economic and labour market recovery varies**: Half of the countries managed to exceed the pre-crisis level – measured by index point values over time – by 2016.
- **Four countries** (Greece, Italy, Cyprus and Finland), on the other hand, were **unable to match the performance of 2008**, the year before the financial and economic crisis, by 2019, the year before the COVID-19 economic slump.

Development of the index point values of the countries in dimension 1

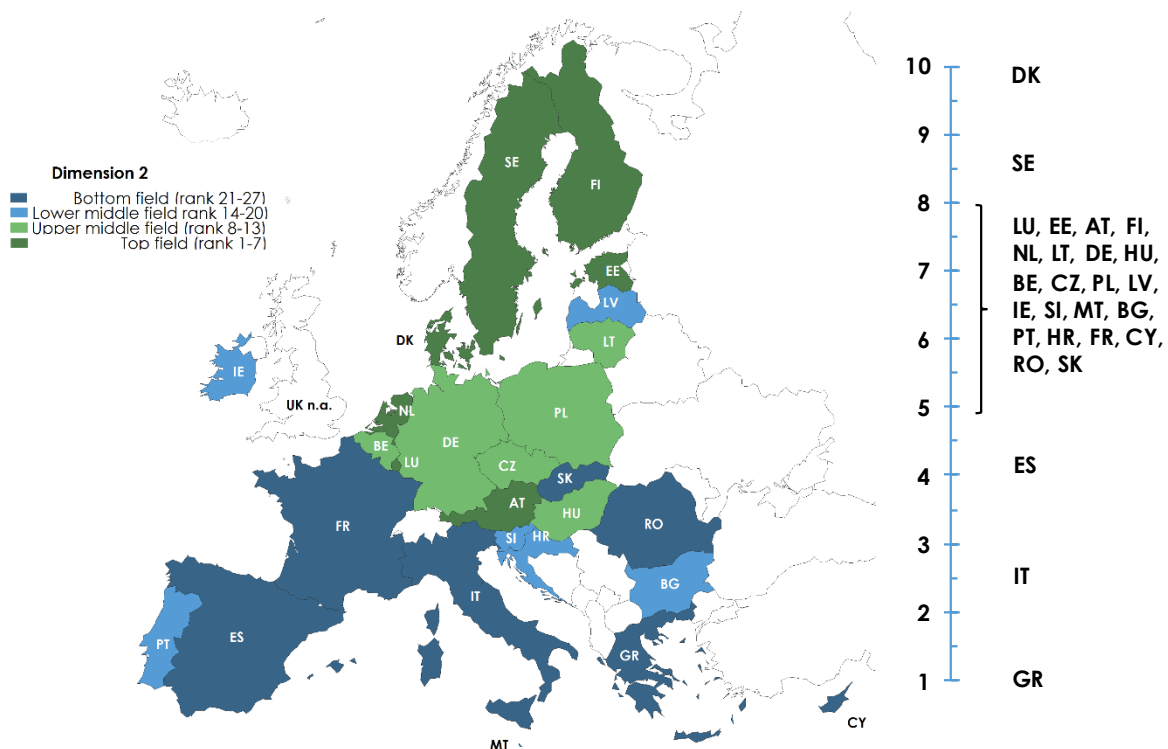

Reference year 2019, EU 28

S: Labour Market Monitor 2020. – Range of index point values. Reading example: The box plot diagram visualizes the scatter and location of the countries' scores per year. In the box (green plus blue area) are the middle 50% of the countries, i. e. the upper and lower middle field. They are limited by the upper and lower quartile; the transition from the green to the blue area represents the median: 50% of the countries are smaller or equal to this value. The edges of the box plot mark the country with the lowest and highest score in the year or the country with the worst rank and the best rank per year. – To compare the index point values over time, the index point values were normalized on the basis of a global minimum and maximum, i. e. for each indicator the smallest and the largest value in the period 2008 to 2019 was searched for and used for normalization (min-max method).

Dimension 2 "Participation"

Dimension 2, "Participation", captures the extent to which the labour market and employment system is able to integrate different groups of people. It comprises 13 indicators: Indicators on employment (employment rates of different age groups, employment gender gap, involuntary part-time employment, involuntary temporary employment), indicators on the unemployment structure (unemployment rate of young and older people, long-term unemployment rate and long-term unemployment rate of older people) as well as indicators from the field of active labour market policy (expenditure as a percentage of GDP and as a percentage of GDP per percent unemployed, participation in labour market measures).

S: Labour Market Monitor 2020. – Index calculation without UK.

What characterizes the countries of the top field?

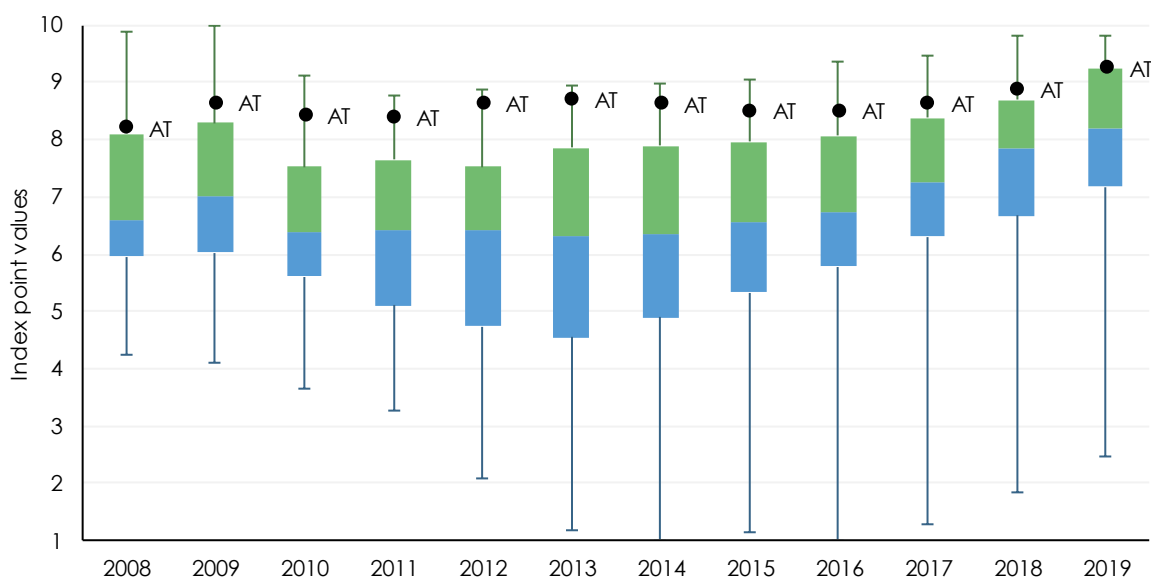

- Common to all top countries is a **below-average long-term unemployment rate** (EU 28 40.5%), an **above-average employment rate** between 25 and 44 years (EU 28 80.8%) and a **below-average gap** in the **employment rate of women and men** (15 to 64 years; EU 28 10.3 percentage points).
- The majority of countries of the top field **invest heavily in active labour market policies**.

Development of the "Participation Index" of 23 EU member states since 2008⁴⁾

- In the course of the financial and economic crisis, the **integration of different groups of people** into the labour and employment system has deteriorated overall. The differences between the countries have increased (**divergence**).
- The **greatest country differences** in performance can be seen in **2016**.
- **Improvement in the course of the economic recovery**: Three quarters of the countries perform better in the subdimensions of employment and unemployment in 2019 than before the financial and economic crisis; however, **the recovery in most of these countries began late** – from 2017 onwards.

Development of the index point values of the countries in dimension 2 – Indicators 1 to 10

Reference year 2019, EU 28 without CY, LT, LU, MT and UK

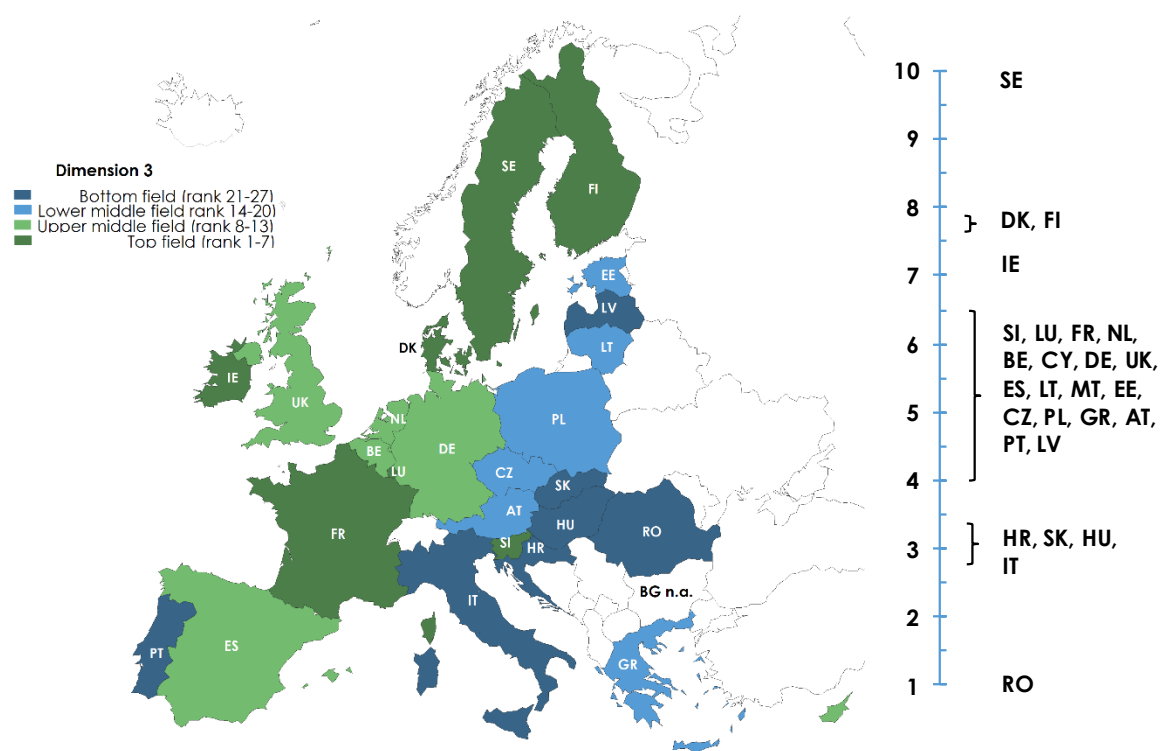

S: Labour Market Monitor 2020. – Range of index point values. Reading example: The box plot diagram visualizes the scatter and location of the countries' scores per year. In the box (green plus blue area) are the middle 50% of the countries, i. e. the upper and lower middle field. They are limited by the upper and lower quartile; the transition from the green to the blue area represents the median: 50% of the countries are smaller or equal to this value. The edges of the box plot mark the country with the lowest and highest score in the year or the country with the worst rank and the best rank per year. – To compare the index point values over time, the index point values were normalized on the basis of a global minimum and maximum, i. e. for each indicator the smallest and the largest value in the period 2008 to 2019 was searched for and used for normalization (min-max method).

⁴⁾ EU 28 without CY, LT, LU, MT and UK. – Indicators 1 to 10.

Dimension 3 "Exclusion Risks on the Labour Market"

Dimension 3 deals with the main determinants of labour market opportunities; it comprises 20 indicators on aspects of education, exclusion, health and childcare: The education dimension comprises seven indicators reflecting the level of education and participation of the population in further education; the exclusion dimension comprises two indicators reflecting individual care obligations and an indicator of the level of inactivity at working age. The childcare dimension shows the extent to which a country offers childcare infrastructure. The health dimension contains eight indicators that show the general health status of the (working age) population.

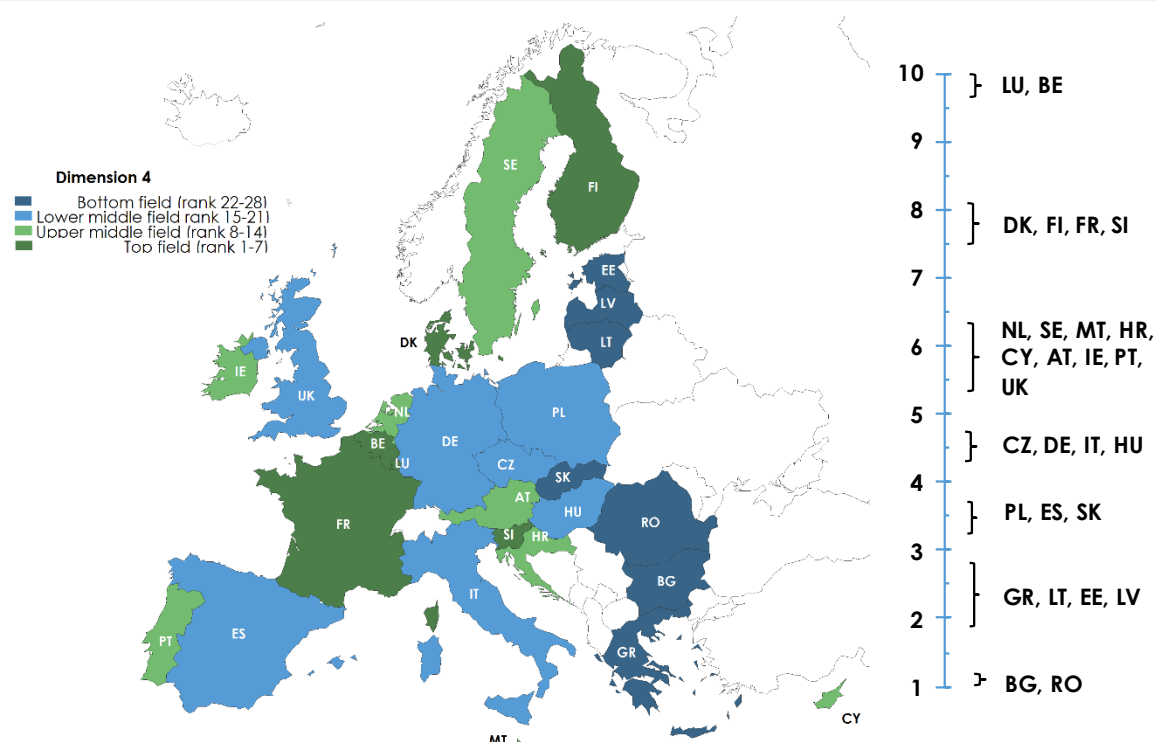

S: Labour Market Monitor 2020. – Index calculation without BG.

What characterizes the countries of the top field?

- The top countries tend to perform relatively **well in the subdimensions of education and childcare**.
- The **share of 25- to 64-year olds with tertiary education** (EU 28 33.3%) and **participation in lifelong learning** (EU 28 11.3%) are mostly **above average**.
- The **childcare rate** for under-3-year-olds is **above average** in all top countries (EU 28 35.5%). For most of the top countries, this also applies to the childcare rate with a time use of 30+ hours per week (EU 28 18.9%).

Dimension 4 "Distribution of Earnings"

Dimension 4 deals with the level and distribution of income. Eight indicators are included in the assessment: the average level of earnings, the functional and personal distribution of primary incomes (compensation of employees in percentage of GDP and income distribution quintiles as a measure of inequality in income distribution), taxes on labour as a percentage of total taxation, the gender pay gap and the proportion of the low-wage earners (basis: gross hourly earnings) as well as the extent of "working poor".

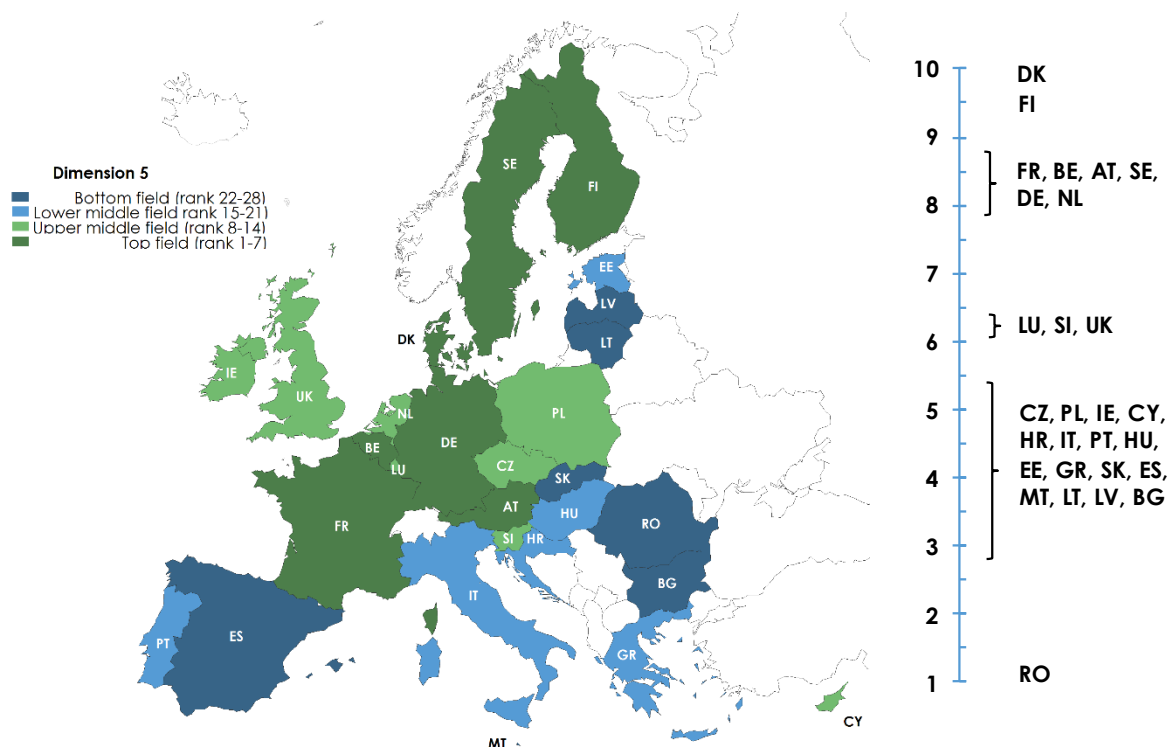

S: Labour Market Monitor 2020.

What characterizes the countries of the top field?

- **Income inequality** (income quintile share ratio EU 28 5.1) and the share of **working poor** (EU 28 9.2%) are relatively **low** (below average) in the countries of the top field (except for Luxembourg in each case).
- Most of the countries have **above-average incomes** (nominal remuneration EU 28 30,448 €; compensation of employees 38,155 €).
- In most of the countries of the top field, **an above-average share of tax revenue comes from labour** (EU 28 49.9%). The relative importance of the factor labour is therefore high; this figure does not allow any conclusions to be drawn about the absolute burden on the factor labour and the tax ratio.

Dimension 5 "Redistribution by the Welfare State"

Dimension 5 focuses on social welfare and levels of transfer in the EU countries. The index encompasses a total of ten indicators: Six indicators on the extent and structure of social protection benefits by various functions (sickness/health care, old age, family/children, unemployment, disability, survivors/social exclusion/housing), one indicator on educational expenditure as a percentage of GDP, and three indicators on the risk of poverty.

S: Labour Market Monitor 2020.

What characterizes the countries of the top field?

- In line with the conception of this index, the top countries spend **an above-average share of GDP on social benefits** (EU 28 26.5%).
- In most top countries, the **at-risk-of-poverty rate** (after social transfers) is **below the EU average** (EU 28 16.8%). In most of these countries, social transfers make an above average contribution to reducing the at-risk-of-poverty rate (EU 28 8.3 percentage points).
- Countries with a **low at-risk-of-poverty rate** also tend to have a **low at-risk-of-poverty gap** (i. e. a smaller gap between the average income of people at risk of poverty and the at-risk-of-poverty threshold).
- Most of the countries of the top field have **above-average educational expenditure** as a percentage of GDP (EU 28 4.7%).

Table appendix

In the following, both the raw data and the results of the Labour Market Monitor 2020 are presented in tabular form of the rankings. At the request of experts from the Vienna Chamber of Labour, some indicators were included in the raw data on a gender-specific basis, so separately for men and women. However, indicators which are presented by gender are only included in the calculation of the respective dimension indices as "total".

The calculation of the sector indices is based, with a few exceptions, predominantly on the years 2018 and 2019; exemptions are indicated. In the case of equal index point values, countries take the same rank; coloured markings indicate these cases.

Where available, the raw data are presented for the EU 28. However, due to missing data, not all 28 EU countries could be included in the calculation for two of five dimensions.

S: Eurostat, WIFO-calculations. – ¹⁾ Unemployment expenses in % of GDP divided through unemployment rate. ²⁾ Other functions contain expenditures on survivors, housing and social exclusion. – Blue cells indicate that the two consecutive countries have the same rank due to equal index point values. Green cells indicate that the three consecutive countries have the same rank due to equal index point value. Turquoise cells indicate that the four consecutive countries have the same rank due to equal index point values.
