A Europe-wide Labour Market Monitoring System Updated Annually

Executive Summary: EU in a Nutshell

Ulrike Huemer, Helmut Mahringer

March 2019

Austrian Institute of Economic Research

Commissioned by the Chamber of Labour: Vienna

Internal review: Hedwig Lutz • Research assistance: Anna Albert

Abstract

The report is an update of a set of labour market indices first developed and tested in 2010 in collaboration with experts of the Vienna Chamber of Labour (AK). The Austrian labour market is examined relative to the other 27 EU countries (including UK) according to the following key dimensions: overall labour market performance, participation of different groups of people, exclusion risks on the labour market, distribution of earnings and redistribution by the welfare state.

1. Introduction

The assessment of the labour market situation in the European Union is often carried out by Eurostat on the basis of a few regularly updated key indicators. In particular much emphasis is placed on the unemployment rate. However, focusing on a single indicator captures only a certain aspect of the labour market. Employment opportunities and national labour markets are diverse. Against this background, the Vienna Chamber of Labour (AK) aims to more closely examine a broader spectrum of labour market issues within a European context. In 2010, in collaboration with WIFO, a team of AK (Austrian Federal Chamber of Labour) and ETUI (European Trade Union Institute) experts identified five key labour market dimensions:

1. Overall labour market performance
2. Participation
3. Exclusion risks on the labour market
4. Distribution of earnings
5. Redistribution by the Welfare State

Based on a series of indicators, an index was created for each of these five dimensions and applied to all EU member countries. The labour market monitor therefore consists of five separate indices (dimensions). Each index can have a value between 1 and 10 for the countries considered, with 10 representing the best and 1 the worst possible outcome.

The labour market monitor should represent a monitoring system that condenses significant aspects of labour market development from a multitude of indicators. Indicators that are comparable and regularly available throughout Europe are used. This facilitates regular updates of these indices and allows for monitoring over time. The present edition represents the eighth update of the labour market monitor.

The advantage of this set of instruments lies in the

- bundling of complex economic, political and social contexts into a few index values,
- comparability of national conditions, which can also be used for benchmarking,
- regular and fast updates,
- creation of a descriptive overview that can serve as a starting point for more in-depth analysis.

However, the generation of indices also represents a tightrope walk. On the one hand, indices reduce the complexity of the information processed; on the other hand, it is precisely this simplicity that bears the risk of misinterpretations – we aim to counteract by a transparent methodology and documentation of data and methods as well as by the separate presentation of five aspects of the labour market.

The present report summarises the current results¹ of the five dimensions: It provides a (carto-)graphic overview and presents the main characteristics of the top countries in the five key labour market dimensions. In addition, this year's edition of the Executive Summary outlines the long-term development of labour market performance (dimension 1 – overall labour market performance index).

2. Labour market monitoring with the labour market monitor

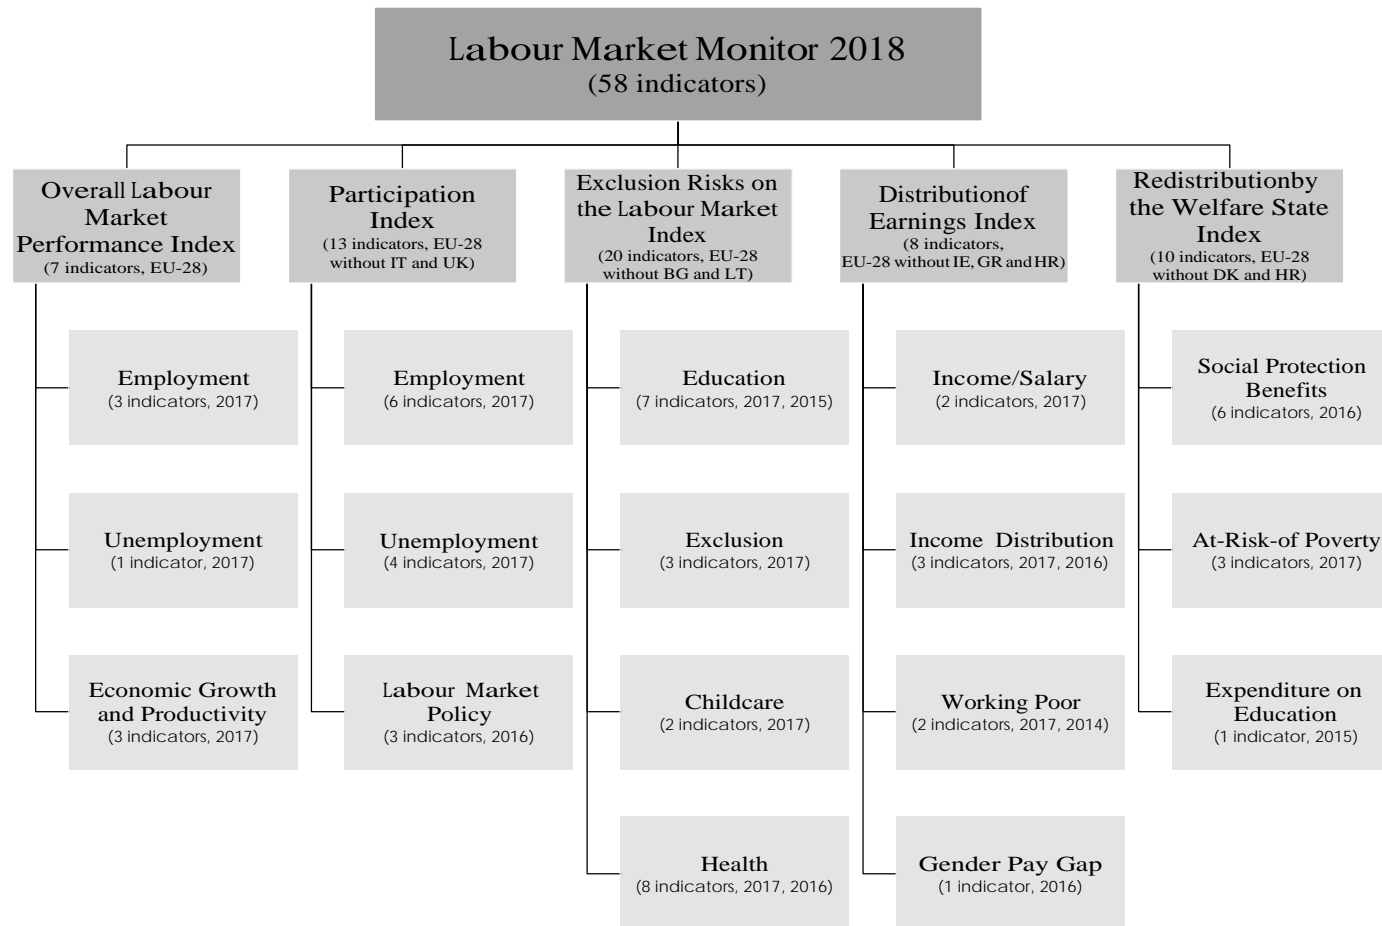

A total of 58 indicators are represented in the labour market monitor and its five dimensions. Content related considerations, as well as the aspects of regular availability and comparability of data determined the selection of indicators. The labour market monitor is mainly based on data from Eurostat (EU-LFS and EU-SILC) and always uses the most recent data – in the 2018 labour market monitor these were primarily data from the years 2016 and 2017. However, not all indicators are as quickly and completely available as others. Where the most recent data for individual countries are missing, data from the previous year are used. If this information is also missing, the country in question is left out of the calculation.

2.1 The five dimensions

The first two dimensions reflect general aspects of the labour market and are measured based on seven respectively 13 indicators. Dimension (1), "overall performance", refers to the labour market in the context of the overall economic situation of a country based on the interplay of employment, unemployment, economic growth and productivity (seven key indicators). Dimension (2), "participation", captures the extent to which different groups of people (e.g. young and old, women and men) are integrated into the labour market. The third dimension (3), "exclusion risks on the labour market", should capture the capacity of a country to enable fair access to the labour market and the chances of remaining employed; here, an important role is undoubtedly played by the level of education and the availability of childcare infrastructure, and 20 indicators are used in this dimension. The fourth (4) and fifth (5) dimensions mainly reflect differences in earnings and Welfare State activities within the European Union: dimension (4) shows the "distribution of earnings" based on eight indicators; dimension (5) "redistribution by the Welfare State" uses ten indicators to measure the effectiveness of state interventions and public expenditures for social protection and education.

Source: WIFO.

3. Index methodology

The calculation of the five dimensions is based on standard methods of index construction (see Haas et al. 2010, p. 15ff). This involves a five-step process. In a first step, the indicators, which are in part measured in different units (e.g. Euros, percentage shares) are normalized by using the min-max method. In a second step, the standardized indicators are transformed on a scale of 1 (worst value) to 10 (best value). In a third step, the indicators are weighted (on the basis of their standard deviation), thus making sure that indicators with a higher variation are not represented disproportionately higher or exert a higher influence on the overall index. In a fourth step, the values gained for each index in steps 1 to 3 are added together and once again normalized and transformed. In this way, the different country and dimension indicators of the Labour Market Monitor are condensed into one index figure.

Figure 2: Multi-step calculation process for the five indices

Source: WIFO.

Finally, a sensitivity analysis is applied to test the robustness of our results and compares the performance of the index to alternative configurations (change of weighting of indicators or the composition of indicators per index). This model proves highly robust with respect to the different weighting variations and selection of indicators.

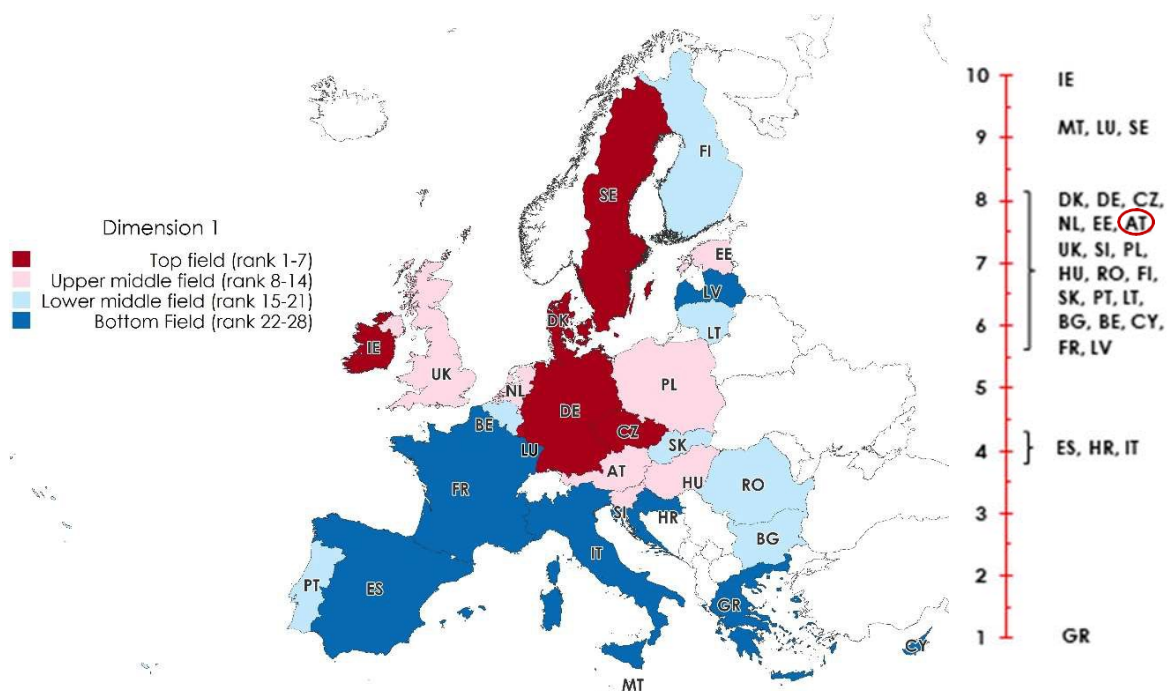

3.1 Presentation of results

Based on the calculated point values four country groups are formed along the quartile limits ("top" field, "upper middle field", "lower middle" field, and "bottom" field). These country groups are used to carry out a comparison to the previous year): not the changes in rankings but rather the categorization of the Member States in terms of the four groups of the distribution are evaluated. In forming four equally occupied country groups, however, the distance in point values between neighbouring groups can be quite small. For this reason, an additional alternative group categorisation is carried out: countries are clustered in such a way as to minimize the distance between the countries point values within each group, while at the same time maximize the distance to the neighbouring groups (point difference of at least 0.5 on the ten-part point value scale).

The following points must be taken into consideration when interpreting the indices: despite a comprehensive selection process of figures, an index can never completely capture all national differences and country-specific institutional contexts. Thus, the results are to be understood as an approximation of a labour market country pattern.

Dimension 1 – Overall Labour Market Performance Index

The first dimension "Performance of the labour market " contains 7 indicators that represent the labour market performance of a country in an overall economic context: The extent of employment of the working-age population (employment rate, employment rate in full-time equivalents) and employment growth compared to the previous year, the current level of unemployment (unemployment rate) and the economic performance of a country (economic growth and productivity: real GDP per capita – absolute value in Euros and development over time, as well as labour productivity per person employed).

S.: Labour Market Monitor 2018.

What characterizes the countries of the top field?

- High economic performance: Most of the top countries have a very high real GDP per capita (LU 80,300 €, IE 56,400 €, DK 47,100 €, SE 42,800 €), with above-average labour productivity per employee. Those countries in the top field with a below-average real GDP per capita show an above-average economic growth rate (10-year perspective).
- The top countries are characterised by either a very high employment rate (SE 76.9%, DE 75.2%, DK 74.2% and CZ 73.6%) or an average employment rate combined with very high employment growth (MT 5.3%, LU 3.4%, IE 2.9%).
- Unemployment in the countries of the top field is below average.

10-year-trend in the Overall Labour Market Performance Index of the EU-28

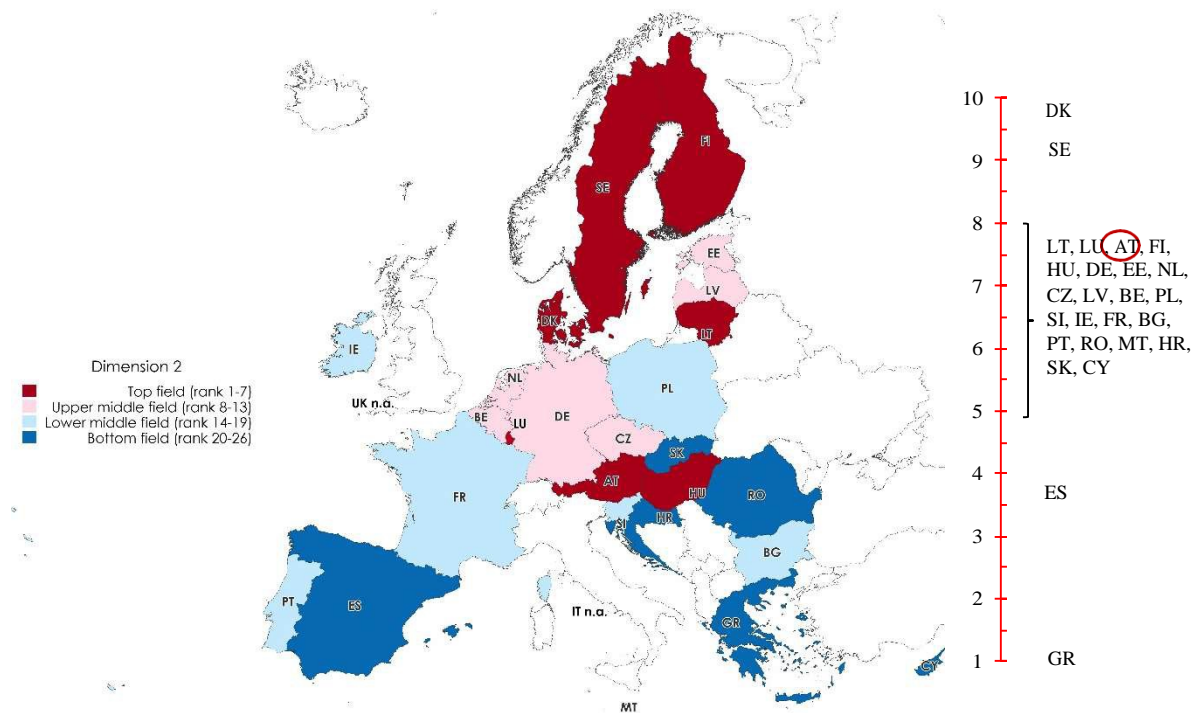

- Marked increase in divergence between EU member states in the wake of the financial and economic crisis.
- Since 2014 there has again been a tendency towards convergence of the labour market performance of the EU member states.
- At present (data for 2017) there is still a massive discrepancy in the labour market performance of the EU member states; it is considerably stronger than before 2009.
- The differences in labour market performance between the euro countries are considerably greater than among the non-euro countries; Greece is the driver of this finding.

S.: Labour Market Monitor 2018. – Range of index points. Legend: The box plot diagram visualizes the scatter and location of the countries' scores per year. In the box (blue plus pink area) are the middle 50% of the countries, i.e. the upper and lower middle field. They are limited by the upper and lower quartile; the transition from the blue to the pink area represents the median: 50% of the countries are smaller or equal to this value. The edges of the box plot mark the country with the lowest and highest score in the year or the country with the worst rank and the best rank per year.

Dimension 2 – Participation Index

Area index 2 "Participation Index" captures the extent to which the labour market and employment system is able to integrate different groups of people. It comprises 13 indicators: Indicators on the employment structure (employment rates of different age groups, employment gender gap, involuntary part-time employment, involuntary temporary employment), indicators on the unemployment structure (unemployment rate of young and older people, long-term unemployment rate and long-term unemployment rate of older people) as well as indicators on the level of activity of active labour market policy (expenditure as a percentage of GDP and as a percentage of GDP per percent unemployed, participation in labour market measures).

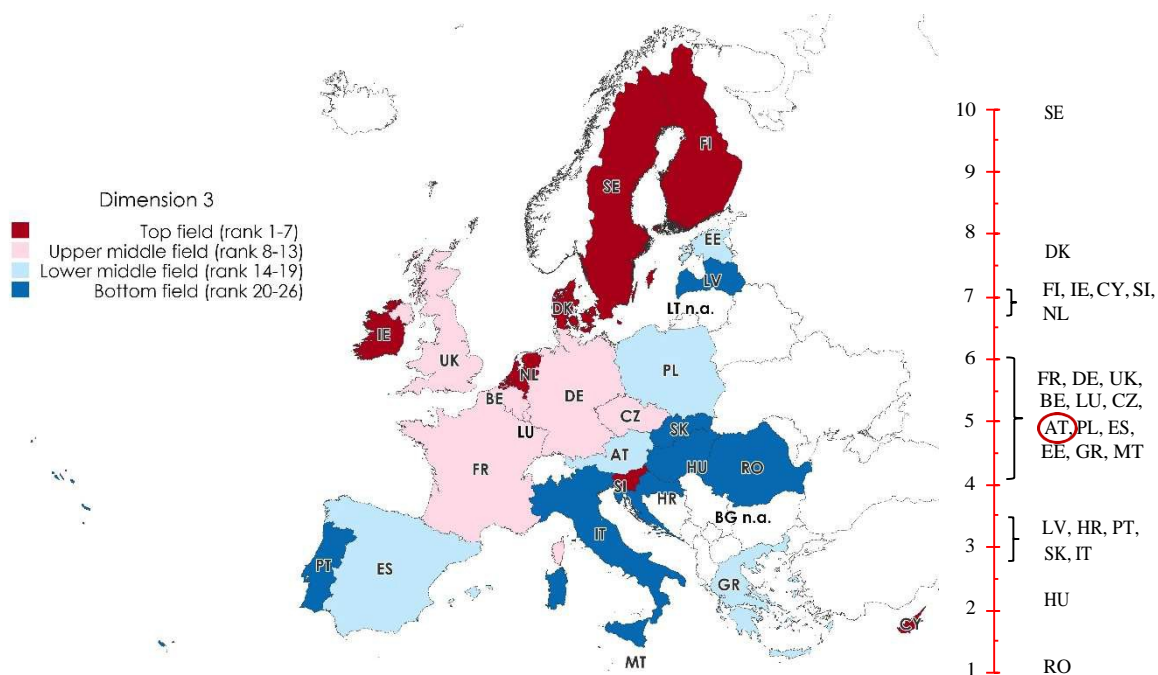

S.: Labour Market Monitor 2018. – Index calculation without United Kingdom and Italy.

What characterizes the countries of the top field?

- The countries of the top field have different strengths and weaknesses.
- All top countries have in common a below-average long-term unemployment rate (EU-28 45.1%).
- In most countries of the top field, investment in active labour market policy is high (expenditure on active labour market policies as a percentage of GDP).
- In most countries of the top field employment rate for people of prime working age (25 to 44 years) is above average (EU-28 79.3%) and the employment gender gap is below average (EU-28 10.5 percentage points and 12.5 at the age of 25-44).

Dimension 3 – Exclusion Risks on the Labour Market Index

Area Index 3 "Exclusion risks on the labour market" deals with the main determinants of labour market opportunities; it comprises 20 indicators on aspects of education, exclusion, health and childcare: The education dimension comprises seven indicators reflecting the level of education and participation of the population in further education; the exclusion dimension comprises two indicators reflecting individual care obligations and an indicator of the level of inactivity at working age. The childcare dimension shows the extent to which a country offers care infrastructure. The health dimension contains eight indicators that show the general health status of the (working age) population.

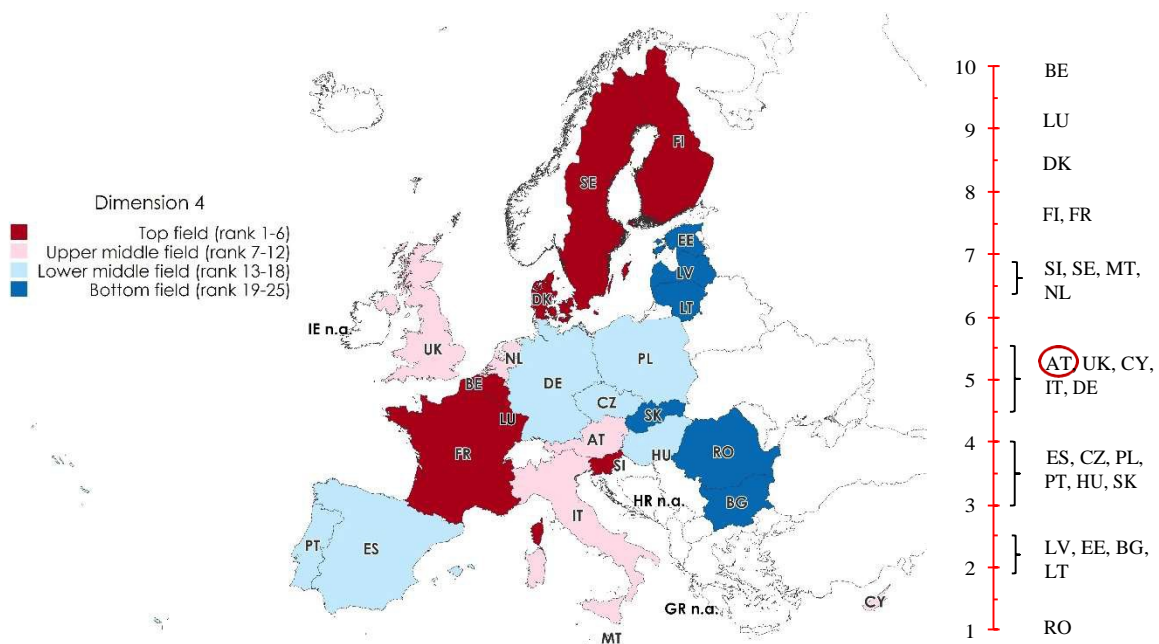

S.: Labour Market Monitor 2018. – Index calculation without Bulgaria and Lithuania.

What characterizes the countries of the top field?

- Countries which are best at minimising the risks of exclusion from the labour market tend to perform well in education: the NEETS rate (EU-28 10.6%) and the proportion of people of working age with no more than compulsory education (EU-28 22.5%) are below average, the proportion with tertiary education (EU-28 31.5%) above average.
- In most of the top field countries, the inactivity rate (EU-28 26.7%) and the part-time rate due to care responsibilities are below average (EU-28 4.3%).
- However, the results of the top field countries in the other two areas – health and formal childcare – are heterogeneous.

Dimension 4 – Distribution of Earnings Index

The area index 4 "Distribution of Earnings Index" deals with the level and distribution of income. Eight indicators are included in the assessment: The average level of earnings, the functional and personal distribution of primary incomes (compensation of employees in percentage of GDP and income distribution quintiles as a measure of inequality in income distribution), taxes on labour as a percentage of total taxation, the gender pay gap and the proportion of the low-wage earners (basis: gross hourly earnings) as well as the extent of "working poor".

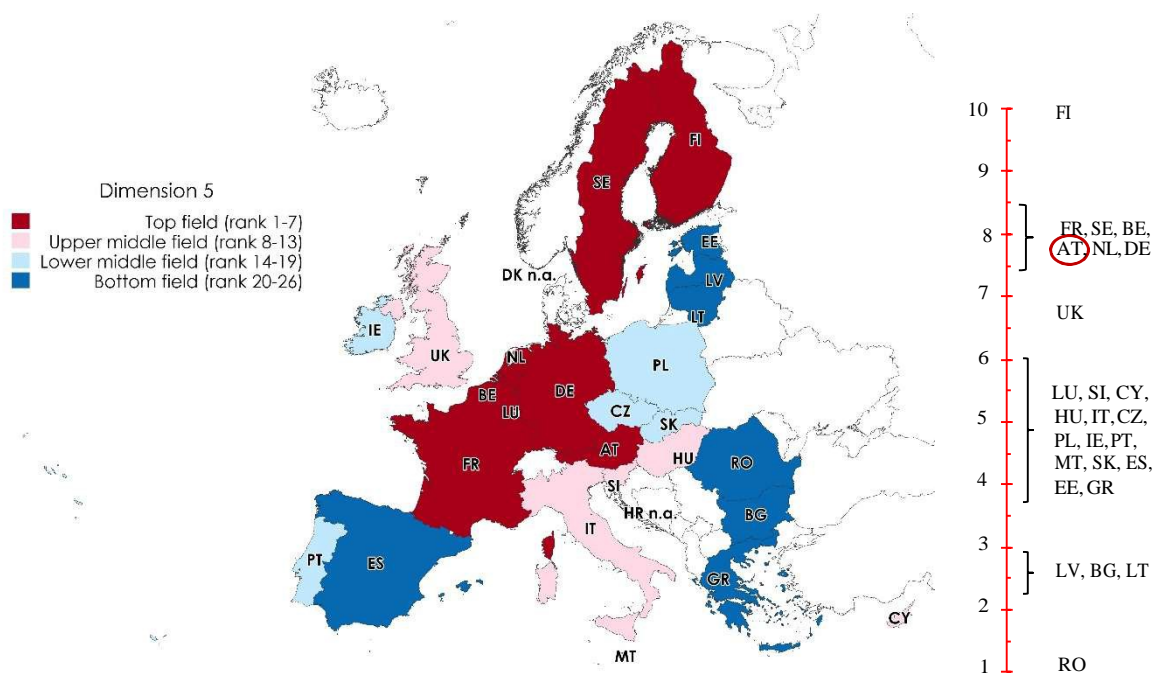

S.: Labour Market Monitor 2018. – Index calculation without Greece, Ireland and Croatia.

What characterizes the countries of the top field?

- Income inequality in the countries of the top field is below average. In 2017, the income of the 20% of the population in the European Union (EU-28) with the highest income was 5.1 times higher than that of the 20% with the lowest income.
- The smaller the extent of income inequality, the smaller the proportion of the "working poor".
- The gender pay gap (EU-28 16.2%) and the proportion of low-paid workers (EU-28 17.2%) are below average in most of the top field countries.
- In most of the top countries, an above-average share of tax revenue comes from labour (EU-28 49.8%). The relative importance of labour in the tax system is therefore high; however, this indicator does not allow any conclusions on the absolute tax burden on labour and the tax ratio.

Dimension 5 – Redistribution by the Welfare State Index

The "Redistribution by the Welfare State Index" focuses on social welfare and levels of transfer in the EU countries. The index encompasses a total of ten indicators: Six indicators on the extent and structure of social protection benefits by various functions (sickness/health care, old age, family/children, unemployment, disability, survivors/social exclusion/housing) and one on educational expenditure as a percentage of GDP as well as three indicators on the risk of poverty.

S.: Labour Market Monitor 2018. – Index calculation without Croatia and Denmark.

What characterizes the countries of the top field?

- According to the conception of this index, the top countries spend a relatively high share of GDP on social benefits.
- The countries of the top field have an at-risk-of-poverty rate below EU average (EU-28 16.9%).
- Countries with a low at-risk-of-poverty rate also tend to have a low at-risk-of-poverty gap.

Table appendix

In the following, both the raw data and the results of the main version of the Labour Market Monitor 2018 are presented in tabular form of the rankings. At the request of experts from the Vienna Chamber of Labour, some indicators were included in the raw data on a gender-specific basis, so separately for men and women. However, indicators which are presented by gender are only included in the calculation of the respective dimension indices as "total".

The calculation of the sector indices is based, with a few exceptions, predominantly on the years 2017 and 2016; a footnote indicates whether a year other than 2017 or 2016 is included in the calculation of the respective sector indices. Some countries have the same ranking because they have the same scores. Equal rankings are also indicated by footnotes.

The raw data are presented for all EU-28 member states. However, due to missing data, not all EU-28 member states could be included in the calculation for four out of five range indices.
