

Measuring Inequality in Wealth and Income - Evidence from Swiss Tax Data

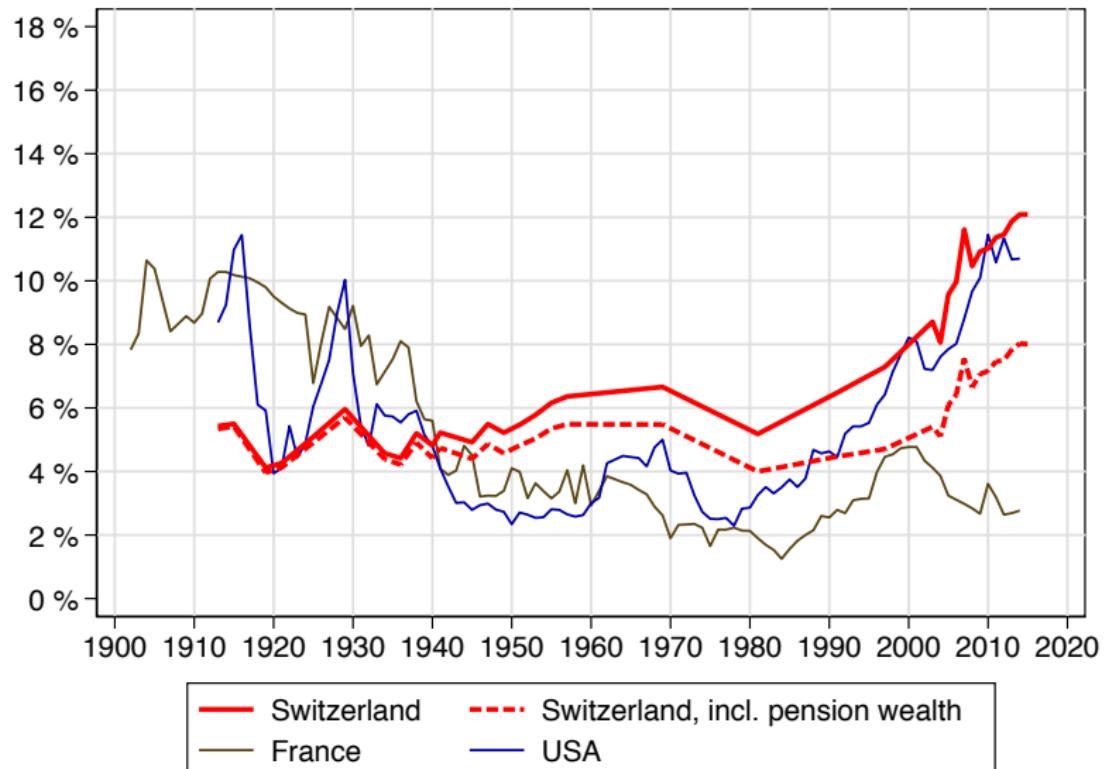

Isabel Z. Martínez

KOF Economic Institute ETH Zürich

AK Young Economist Conference, Vienna

October 2, 2020

Top 0.01% Wealth Shares in International Comparison

Source: www.wid.world; Piketty (2014), Föllmi and Martínez (2017)

Why so much emphasis on measurement?

In academia:

- Measuring distribution has a long tradition in inequality research (Pareto, 1896; Kuznets, 1953, 1955; Atkinson et al., 1970, and many more)
- More recent contributions:
 - Long-run evolution (Piketty, 2001; Piketty and Saez, 2003; Atkinson and Piketty, 2007; Atkinson et al., 2010; Föllmi and Martínez, 2017)
 - Estimate top wealth shares in the U.S. (Kopczuk and Saez, 2004; Fagereng et al., 2016)
 - Wealth income ratios (Piketty and Zucman, 2014; Piketty, 2014)
 - Capture the entire population and economy, e.g., DINA (Garbinti et al., 2018; Alvaredo et al., 2017)

In practice:

- Policies depend on and affect the distribution

Knowing the distribution is crucial for optimal policy

- Pension policy:
 - How rich are the elderly in terms of income and wealth?
- Wealth tax policies:
 - OECD (2018): The Role and Design of Net Wealth Taxes
 - US: wealth tax proposals (Warren, Sanders)
 - CH: national inheritance tax initiative (2015)
 - CH: higher tax on capital incomes (99% initiative)
 - Sensitivity of wealth to taxation
(Brülhart and Parchet, 2014; Brülhart et al., 2019)

The tax system helps measuring income and wealth

Aggregated Data

- Income / Wealth tax statistics
 - Can approximate distribution very well
 - + Very long-run series (entire centuries)
 - + Top very well covered

Individual Data

- Individual tax records
 - + Detailed income and wealth measures
 - + Joint distribution income / wealth
 - – Few individual characteristics
- Survey data
 - + Individual characteristics
 - – Top not well covered

→ Access to admin data key: *advance research + improve policies!*

What's there to measure? (or: the paper)

- Wealth inequality
 - Understudied compared to income
 - Wealth highly concentrated
- Composition matters
 - Changes in wealth components influence inequality differently
- Joint distribution of income and wealth important
 - have those with low income also little wealth?
- Mobility and opportunities
 - Life-cycle dynamics
 - Intergenerational: who will receive large inheritances?

Data: Cantonal Income and Wealth Tax Data

Institutional background:

- Federal country with strong tax autonomy at cantonal level
- Federal income tax
- Cantonal income and wealth tax
- Residence-based taxation
- Cantons collect cantonal + federal tax

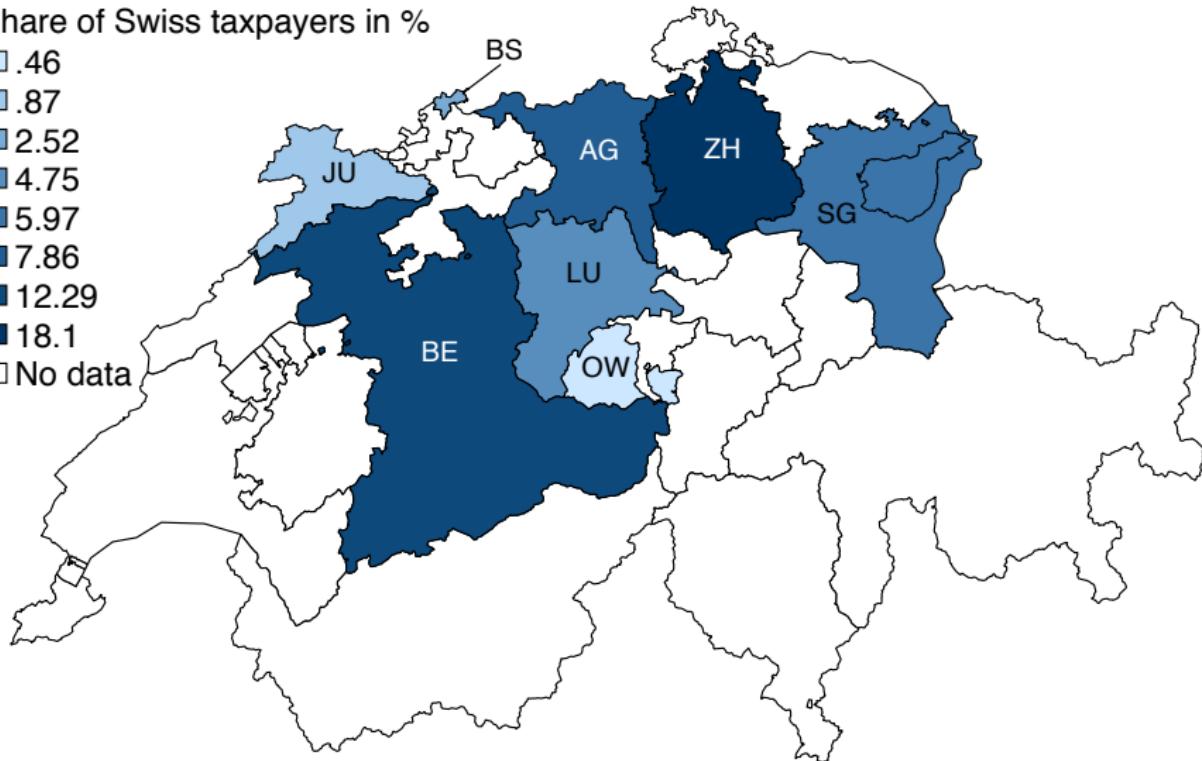

Data:

- Individual tax register data from 8 cantons:
ZH, BE, LU, BS, SG, AG, OW, JU
- 53% of the total population of taxpayers
- Varying years 2001-2016 – but only 2010 for all cantons!
- Unit of analysis: individual
→ income / wealth of married couples split equally

Data: Cantonal Income and Wealth Tax Data (2010)

Share of Swiss taxpayers in %

1 Introduction

2 Insights from Individual Tax Data

- Tax Data (2010)
- Wealth Composition (skipped)
- Joint Distribution
- Inheritances

3 Conclusion

Likelihood of Inheritances and Gifts by Age

(BE, 2002-2012 pooled)

► Avg. amount

Likelihood of Inheritances and Gifts by Wealth Percentile (BE, 2002-2012 pooled)

► Avg. amount

Conclusions: Distribution and Composition

- Substantial differences in wealth (and income) composition along the distribution
- Strong association between income and wealth, especially at the tails
- Strong, positive age-wealth nexus
- Wealth-income ratios
 - rise with income
 - very high for retirees, low for people below age 50

Conclusions: Mobility

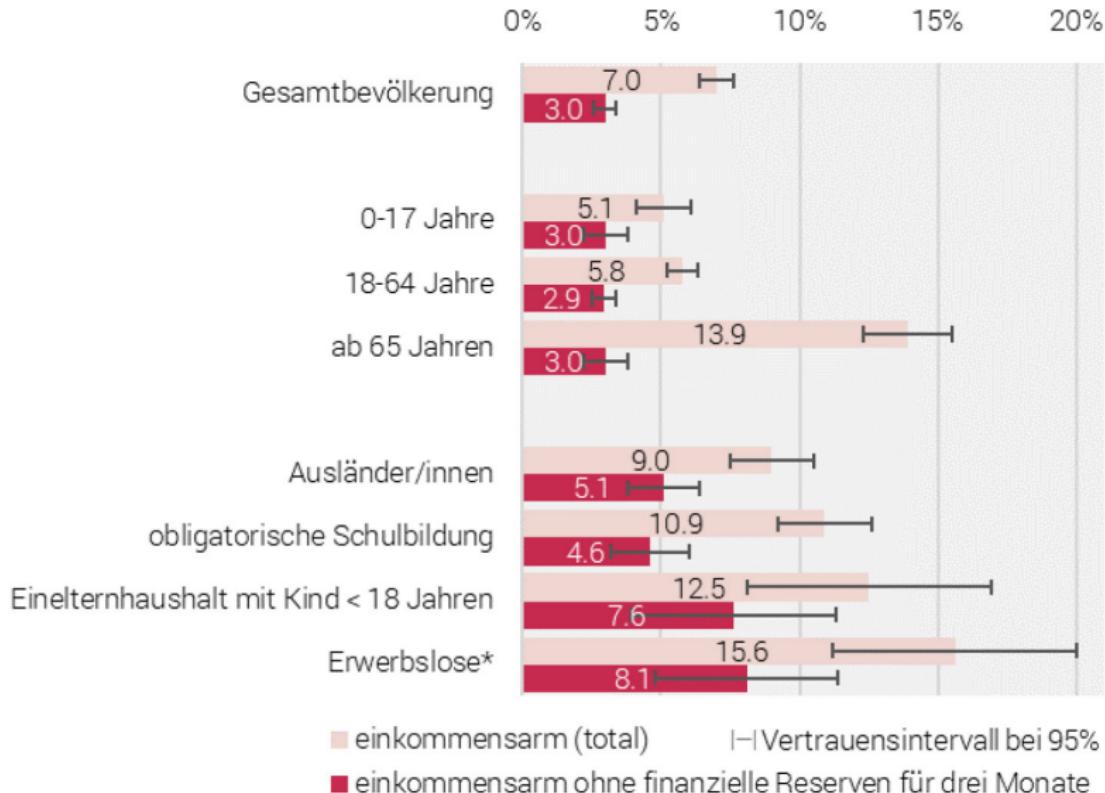

- Climbing the wealth distribution is harder than climbing income distribution
- Intra-generational wealth mobility (s)low
- Inheritances increase intra-generational mobility
- Inheritances more likely...
 - ... around retirement age
 - ... for wealthier individuals
- → Inter-generational link in wealth transmission seems strong

Thank you.
